0 Section 0: Background

A. Charge

i. Workgroup charter and bylaws 8-23-2022

From the "[Benton County Talks Trash](#)" [Workgroup Charter and Bylaws](#) document, Topic A:

A. Develop Common Understandings to form the basis of the work.

- 1) A chronological history of key Coffin Butte Landfill topics:
 - a. Size;
 - b. Specific locations;
 - c. Conditions of past land use approvals;
 - d. Compliance with prior land use approvals and SWMP;
 - e. Reporting requirements;
 - f. Assumptions (e.g. when will the landfill close;)
 - g. Economics (i.e. Benefit – Cost, etc.) and
 - h. Examples from other jurisdictions hosting landfills, e.g.:
 - i. Typical land use conditions of approval; and
 - ii. Issue sequencing, (e.g. in what order are landfill versus hauling approvals done, etc.

Subcommittee A.1 charge

The A.1 subcommittee was charged with a subset of the tasks listed above. Specifically, per the [A.1 Subcommittee web page](#):

Charge A: Common Understandings Tasks

- 1) A chronological history of key Coffin Butte Landfill topics:
 1. Size;
 2. Specific locations;
 3. Assumptions (e.g. when will the landfill close;)

Thus the A.1 subcommittee addresses components 1(a), 1(b) and 1(f) of the workgroup charter Topic A tasks.

Charge 3 "Assumptions" is interpreted to mean estimation of the landfill operational lifetime including the assumptions behind this estimation.

Note that for the A.1 subcommittee, "chronological history" is limited specifically to these three topics; a more general history of the landfill will be addressed by another body.

Commented [SM1]: Suggestion from Ken to add a table of contents.

Common Terms

Landfill means a facility for the disposal of solid waste involving the placement of solid waste on or beneath the land surface. ORS 459.005(14)

Sanitary landfills are intended as biological reactors (bioreactors) in which microbes will break down complex organic waste into simpler, less toxic compounds over time.

Disposal site means land and facilities used for the disposal, handling or transfer of, or energy recovery, material recovery and recycling from solid wastes, including but not limited to dumps, landfills, sludge lagoons, sludge treatment facilities, disposal sites for septic tank pumping or cesspool cleaning service, transfer stations, energy recovery facilities, incinerators for solid waste delivered by the public or by a collection service, composting plants and land and facilities previously used for solid waste disposal at a land disposal site. ORS 459.005 (8)

Regional disposal site means a disposal site that receives, or a proposed disposal site that is designed to receive more than 75,000 tons of solid waste a year from outside the immediate service area in which the disposal site is located. As used in this subsection, "immediate service area" means the county boundary of all counties except a county that is within the boundary of the metropolitan service district. For a county within the metropolitan service district, "immediate service area" means the metropolitan service district boundary. ORS 459.005 (22)

From all particular measures, a landfill is a subset of a disposal site.

Landfill cell means a discrete volume of a landfill which uses a liner system to provide isolation of solid waste from adjacent cells of solid waste. (RI 250-RICR=140-05-1)

Coffin Butte Landfill is a regional disposal site and an engineered sanitary landfill in Benton County, north of Corvallis, located off ~~of~~ Coffin Butte Road. In progress: Verify that this language applies to cells 1 and 1a.

Need definition of Airspace.

Need definition of Permitted Space.

Limit¹: "1. a point or level beyond which something does not or may not extend or pass. "the success of the coup showed the limits of monarchical power". 2. a restriction on the size or amount of something permissible or possible. "an age limit"."

Threshold²: "the magnitude or intensity that must be exceeded for a certain reaction, phenomenon, result, or condition to occur or be manifested. "nothing happens until the signal passes the threshold"."

Definitions

¹ [Definition from Oxford Languages via Google](#)

² [Definition from Oxford Languages via Google](#)

Commented [RD2]: Does this qualify to cells 1 and 1a? Or cells that are unlined?

Commented [PN3]: I think both Republic and Benton Co. should provide their definitions here and we discuss/resolve.

Commented [RD4]: Definition of Limit and Threshold added by Daniel, using Oxford Languages definitions via Google.

Commented [RD5]: Addition from Paul

2000 Landfill Franchise Agreement: The 2000 Landfill Franchise Agreement between Benton County and Valley Landfills Inc., signed December 31, 2000 and effective until December 31, 2020.

2000 Intake Threshold: The intake tonnage level specified mathematically in the 2000 Landfill Franchise Agreement. If the volume of solid waste accepted at the landfill in any calendar year exceeded the annual level, or if the cumulative volume of solid waste accepted at the landfill in any two consecutive calendar years exceeded the two-year level, the County was allowed, at its expense, to perform a new Baseline assessment, and if the County determined this assessment indicated an adverse impact relative to the 2001 Baseline Study an immediate renegotiation of the Franchise Fee and/or Host Surcharge was required.

2001 Baseline Study: The assessment of environmental and infrastructure conditions and areas of potential impacts from the volume of solid waste accepted at the landfill, as mandated in the 2000 Landfill Franchise Agreement. This assessment was completed by the Benton County Health Department with results documented in a report released in 2001. This study included the following elements: Traffic, Soil Conditions and Contamination Levels, Air Quality, Surface and Groundwater Conditions and Contamination Levels, Noise, Odor, Visual Screening, Litter, Hours of Operation, Solid Waste Control Systems and Compliance with all Solid Waste Permits.

2020 Landfill Franchise Agreement: The 2020 Landfill Franchise Agreement between Benton County and Valley Landfills Inc., signed December 21, 2020 and effective from January 1, 2021 until December 31, 2040.

2020 Intake Limit (To Be Replaced With “Tonnage Cap”): The 1.1 M Tons/year “Limit on Solid Waste” defined in the 2020 Landfill Franchise Agreement, in place until “Franchisee’s governmental applications to expand the landfill onto the Expansion Parcel are granted” and stipulated as the level which the total tonnage of solid waste deposited by the franchisee “shall not exceed” during any calendar year, with exceptions for fire, flood, other natural disaster or any Force Majeure event.

“Tonnage Cap” – 1.1 Million Tons/Year of solid waste intake into Coffin Butte Landfill (excluding disaster qualifiers).

Landfill Life ≡ Expected time remaining in which the landfill will continue to accept waste, typically in Years. **Landfill Life (longevity) in a landfill linear economy model is the consumption of its resources in reserve as well as ancillary resources thereby extinguishing its maximum capacity to further dispose refuse?**

End of Life (EOL) ≡ Expected calendar date when the landfill ceases to accept waste, typically in Calendar Years AD.

Franchisee, landfill owner = Republic Services

Airspace:

Commented [RD6]: Moved from Section 3

Commented [RD7]: Added by Chuck - 2.22.23

Commented [RD8]: Addition from Ken Eklund

Commented [RD9]: From Ginger: Maybe insert near the top that Republic Services has been the owner/operator of Coffin Butte Landfill since 2008 (where we are talking about inconsistency of records prior to that point.)

Expansion Parcel: *need confirmation this is tax lot 104180001107, listed as 59.23 Ac.*

Intake Tonnage: The total quantity of solid waste accepted at the landfill in US short Tons (1 Ton = 2000 lbs.). Conversion to airspace volume in cubic yards (yd³) is obtained by mathematically dividing the Intake Tonnage value by the density figure provided by the franchisee for the relevant period (stated in Tons/yd³).

Definition: Remaining Landfill Life (longevity) is the available timeline a landfill will remain open to accept waste placement into its permitted capacity.

Permitted space is the physical volume available for the placement of solid waste. Benton County approves the land use for the landfill's footprint. However, DEQ and the franchisee (Valley Landfills Inc.), approve the cell design that determines the physical volume available. "Airspace" is the resulting volume left within the permitted space for the disposal of solid waste.

Permitted Space:

Service Area:

Tonnage Cap:

"Wasteshed" (To Be Replaced With "Service Area"): Total geographic area from which waste feeds into Coffin Butte Landfill.

"tonnage cap" -> "2020 Intake Limit" (my suggestion is that this is more readable than "Limit on Solid Waste")

"2000 Franchise Agreement Limit" -> "2000 Intake Threshold"

"wasteshed" -> "service area" - this one is debatable; perhaps we should discuss in the meeting

An expansion of a landfill alone without a circular economy would only consume valuable landfill reserve resources in a traditional linear economy model, which operates on a "take, make, use, dispose" model.

A circular economy is an economic model where the waste and pollution generated by society is minimized, and resources are conserved and regenerated by reusing and recycling materials and products. It aims to reduce dependency on finite resources, eliminate waste, and create a more sustainable economy. The circular economy model is in contrast to the traditional linear economy model.

In Republic Services 2021 Sustainability Report, Jon Vander Ark, President and Chief Executive Officer reports, "This is our company vision, which is intentionally ambitious because we believe we are uniquely positioned to help our customers achieve their own sustainability goals. That commitment begins with our Elements of Sustainability – Safety, Talent, Climate Leadership and Communities – and these elements anchor our 2030 sustainability goals".

Commented [PN10]: Daniel: can you confirm this tax lot is the parcel defined in Exhibit C of the 2020 Franchise Agreement?

Commented [RD11R10]: Yes, that is the correct tax lot number for the parcel described in Exhibit C of the 2020 Franchise Agreement.

Commented [RD12]:
From Ginger: Of this 1.1 M Tons per year, 75,000 Tons per year were reserved for Solid Waste from the County exclusively, with the balance of 1.025 M Tons per year being termed the "Tonnage Cap."

My understanding, based on how the contract is drafted, is that the Tonnage Cap is simply 1.1 million. I think it's parsed slightly differently in the sentence above. Maybe say: "The contract states that there is a tonnage cap of 1.1 million tons per year. The agreement specifies that 75,000 tons per year are reserved for municipal solid waste from Benton County (exclusively.)"

Commented [RD13]: From Paul (3 sentences) as a general comment, not for this location specifically.

Commented [RD14]: Following 6 paragraphs from Chuck

Commented [RD15R14]: Add to body of the report

A solid waste management plan is a comprehensive plan for the collection, transport, processing, and disposal of solid waste, such as household trash, industrial waste, and construction and demolition debris. The purpose of a solid waste management plan is to ensure that waste is managed in an environmentally responsible and sustainable manner, while also considering economic and social factors of a circular economy.

In the 2020 landfill franchise agreement under article 5a Benton County and the Franchisee acknowledge that there may be adverse effects to the County's infrastructure and environmental conditions due to increased annual volumes of solid waste accepted at the landfill.

In other words, a solid waste management plan needs to work shoulder to shoulder with sustainability goals in a circular economy within Benton County's proposed sustainable materials management plan and transportation plan.

What is the economical principal of demand and supply equilibrium?

The economic principle of demand and supply equilibrium is a fundamental concept in economics. It states that in a free market, the price of a good or service will settle at a level where the quantity demanded by buyers is equal to the quantity supplied by sellers.

Commented [RD16]: The following 8 questions/answers added by Chuck 2/22/23

What are the economics of a franchise?

A franchise is a business model in which a franchisor grants a franchisee the right to use its trademarks, products, services, and business methods for a specified period of time in exchange for an initial fee and ongoing royalty payments. The economics of a franchise depend on various factors, including the type of franchise, the market conditions, and the terms of the franchise agreement.

What is the economics of a landfill ?

The economics of a landfill refers to the financial costs and benefits associated with operating and managing a landfill. Landfills are a type of waste management facility where garbage and other forms of solid waste are buried underground in order to minimize their impact on the environment.

The economics of a landfill can be broken down into several components:

1. Capital Costs: These are the costs associated with building the landfill, including site preparation, infrastructure development, construction of waste cells, and installation of monitoring systems.

2. **Operating Costs:** These are the ongoing costs associated with running the landfill, including labor costs, equipment maintenance, waste collection, transportation, and disposal costs.
3. **Revenues:** These are the revenues generated from the landfill, which may come from tipping fees charged to waste generators or from the sale of recovered materials such as metals, plastics, or glass.
4. **Environmental Costs:** These are the costs associated with the environmental impact of the landfill, including pollution, greenhouse gas emissions, and impacts on local ecosystems.
5. **Regulatory Costs:** These are the costs associated with complying with local, state, and federal regulations governing the operation of landfills, including permitting, monitoring, and reporting requirements.

Overall, the economics of a landfill depend on a number of factors, including the size, capacity and location of the landfill, the amount and type of waste it receives, the regulatory environment, and the cost of alternative waste management options. Proper management of a landfill can result in a profitable operation, but this must be balanced with the potential negative environmental impacts and the costs associated with mitigating them.

What are resources in reserve in a landfill?

In the context of a landfill, resources in reserve typically refer to the remaining capacity of the landfill to accept waste before it reaches its maximum capacity. This can be estimated by conducting periodic surveys and measurements of the landfill's remaining space, as well as assessing the rate at which waste is being deposited.

The resources in reserve of a landfill are a key consideration in waste management planning, as they determine how long the landfill can continue to accept waste before it reaches its maximum capacity and must be closed. Once a landfill reaches its maximum capacity, it must be closed and monitored for an extended period of time to ensure that it does not pose a threat to human health or the environment.

In addition to the remaining capacity of the landfill, other resources in reserve in a landfill may include materials that can be recovered and reused, such as metals, plastics, and other recyclable materials. Landfills may also be equipped with systems for capturing and utilizing landfill gas, which is a byproduct of the decomposition of organic materials in the landfill.

Overall, the resources in reserve of a landfill are an important consideration in waste management planning, as they determine the landfill's remaining lifespan and its potential for resource recovery and utilization.

What are ancillary resources in a landfill?

Landfill ancillary resources are the resources that can be extracted or generated from a landfill in addition to its primary function of waste disposal. These resources can include both tangible and intangible assets that have value for the landfill operator or for other entities.

Examples of landfill ancillary resources include:

1. Landfill gas: Landfills generate methane and other gases as waste decomposes. This gas can be captured and used to generate electricity, heat, or fuel.
2. Recoverable materials: Certain materials, such as metals, plastics, and glass, can be recovered from the waste stream and sold or recycled.
3. Compost: Some landfills may have the capability to compost organic waste, such as food and yard waste, which can be sold as a soil amendment or fertilizer.
4. Land: Once a landfill has reached the end of its useful life, the land can be repurposed for other uses, such as parks, recreation areas, or commercial or industrial development.
5. Environmental credits: Landfills that reduce their greenhouse gas emissions or implement other environmentally beneficial practices may be eligible for credits that can be sold on carbon markets or other environmental markets.
6. Water: Some landfills may have groundwater resources that can be used for irrigation or other purposes.

Overall, landfill ancillary resources can provide additional revenue streams for landfill operators, reduce the environmental impact of landfill operations, and provide value to the broader community.

What is a landfill linear economy?

A landfill linear economy refers to a waste management approach in which waste is generated, collected, and disposed of in a linear manner, without much emphasis on resource recovery or reuse. This approach is often characterized by a "take-make-dispose" model, where resources are extracted, processed into products, used, and then discarded as waste.

In a landfill linear economy, waste is typically sent to landfills for disposal, without much effort to recover or recycle materials from the waste stream. This can result in the depletion of natural resources and the generation of significant amounts of waste that can pose environmental and health hazards.

In contrast, a circular economy approach to waste management emphasizes resource recovery and reuse, with the goal of reducing waste and conserving natural resources. In a circular economy, waste is treated as a valuable resource, and materials are reused, recycled, or repurposed, rather than being disposed of in landfills or incinerators.

Overall, the concept of a landfill linear economy highlights the need for more sustainable waste management practices that prioritize resource recovery and reuse over disposal. By adopting a circular economy approach to waste management, it may be possible to minimize waste, conserve natural resources, and reduce the environmental impact of waste disposal.

What is refuse?

Refuse is a term used to describe any material or object that is thrown away or discarded because it is no longer wanted or needed. Refuse typically includes waste, garbage, trash, or other types of discarded materials, such as food scraps, old papers, empty containers, and broken household items.

Refuse can take many forms and can come from a variety of sources, including households, businesses, and industrial processes. Proper disposal of refuse is important to prevent environmental pollution, reduce health risks, and conserve resources. Recycling, composting, and other waste reduction strategies can help to minimize the amount of refuse that ends up in landfills or incinerators.

What is consumption of resources in a landfill?

B. Membership Composition

The A.1 Subcommittee membership is composed of four primary representative groups:

1. Franchisee: 3 members (Ian Macnab, Ginger Rough, Bill Bromann, all of Republic Services)
2. Benton County community members ~~SWAC: 3~~ 4 members (Chuck Gilbert*, Mark Yeager*, Ken Eklund*, Paul Nietfeld)
3. County governments: 3 members (Daniel Redick (Benton County), Brian May (Marion County), Shane Sanderson (Linn County))

~~4. Private citizens: 1 member (Paul Nietfeld)~~

Daniel Redick, a Benton County Community Development Department staff member, acts as Chair of this subcommittee.

Sam Imperati, the workgroup facilitator, normally attends subcommittee meetings and provides guidance in regard to aligning with workgroup objectives.

* Also members of the Solid Waste Advisory Council and the Disposal Site Advisory Committee for Benton County

C. Document Organization

This document is organized into sections that correspond to the “Charge” items assigned to the A.1 Subcommittee (i.e. Sections 1, 2, 3 correspond to Charges 1, 2, 3). Section 4 provides additional detail on factors which may impact landfill life.

References to specific sections in this document are in the format <Section #>.<Subsection Letter>.<Subpart Designation>. Thus this location would be referenced as O.C, and the A.1 Subcommittee Charge may be found in O.A.ii.

Please note that staff have incorporated other subcommittee member’s additions, edits, and comments by copying and pasting text from various draft reports received from subcommittee members into the current draft. While staff did provide suggested changes and comments in addition to those received by subcommittee members, the “Track Changes” view, will show that all edits were made by staff, however, much of the changed content was submitted by non-staff subcommittee members. Each draft represents staff’s attempt at combining the entire group’s suggested edits into a single document, and the draft content has not been vetted by the subcommittee. The draft in the full work group report is a simplified version to help with readability, which staff developed by removing redlined content, using the current “draft” content, and only keeping comments that are considered by staff to be essential to the understanding of the draft in the current form. The full subcommittee draft working document includes all of the unresolved comments and edits made over time, which is the document version that the subcommittee will continue to refine.

Commented [PN17]: Remove this section

1 Table of Findings

Key Findings:

The A.1. Landfill Size, Capacity, and Longevity subcommittee proposes 36 findings as part of its overall charge. The committee is not in agreement on all findings, and the following findings have **NOT BEEN REVIEWED** by the full subcommittee. To help guide the reader, the findings are generally grouped by topic. These recommendations do not represent consensus of the subcommittee, and they may be revised by the subcommittee further.

Landfill Estimated Remaining Life, Projected End of Life (EOL)

LSCL-F-1: In 2003 EOL was projected to be approximately 2074, with a Landfill Life estimate of 71 years (2003 East Triangle CUP document, Benton County file PC-03-11.pdf). Twenty years later EOL is projected to be 2037-2039 with a Landfill Life of 14.5-16 years, a reduction of approximately 36 years of estimated life in 20 elapsed years. In 2013 Valley Landfills Inc. reevaluated the engineering of the East Triangle's waste placement stability. The East Triangle was removed from the landfill's site development plan based on updated state seismic guidance for landfill stability.

LSCL-F-2: In 2013 EOL was projected to be 2053-2062, with a Landfill Life estimate of 40-49 years³. Ten years later EOL is projected to be 2037-2039 with a Landfill Life of 14-16 years, a lower and upper range reduction of approximately 16 and 23 years respectively.

LSCL-F-3: Current (1Q2023) estimate for landfill EOL = CY 2037 – 2039 based on an annual intake level of 1.0 – 1.1 MTons/year and a density of 0.999 Tons/yd³, assuming the quarry area will be fully excavated by the time the current disposal areas are full. Valley Landfills, Inc. has represented that this nominal life projection ("baseline") is derived from a few data points in annual measurements, and is the product of a modeling process that is standard in the landfill industry. Valley Landfills, Inc. acknowledges that a variety of factors, including human factors, can impact landfill site life, but are not included in this baseline calculation. Valley Landfills, Inc.'s baseline projection of a 2037-2039 closure date is based both upon existing demand and Valley Landfill Inc.'s efforts to maintain and/or grow its service area and business in the market.

LSCL-F-4: The 2021 Site Development Plan projected a 2039 EOL based on an annual intake of approximately 846,000 Tons/year, but this intake tonnage is not considered binding or controlling by either ODEQ or Valley Landfills, Inc. This is based on the best information available at time of approval by Oregon DEQ, which can change based upon service area impacts.

LSCL-F-5: Under the 2020 Franchise Agreement, the 1.1M tonnage cap is eliminated upon Benton County's approval of a CUP (expansion). If intake volumes increase, an **expansion would not necessarily guarantee an increase in site life** or the extension of the Landfill's closure date.

³ [2013 Coffin Butte Landfill and Pacific Region Compost Annual Report](#)

Commented [RD18]: Notes from 2/23 WG Meeting;

- Include details on preemptively addressing mitigations of unique wastes/disaster wastes. Include information on profiling of waste materials, and the differences between hazardous vs. special waste, including hazardous substances that may be permitted wastes.

Commented [YM19]: Not sure how the order of these findings was determined, but my view is that they should be reorganized and prioritized with most important findings at the beginning. For example, the remaining life finding is now buried near the bottom of this list - that should be moved up

Commented [RD20]: Categories and organization of findings from Paul

Commented [PN21]: Modified historical reference to avoid claim that EPA records are not relevant to landfill life.

Commented [RD22]: Addition from Ken Eklund

Commented [RG23]: Just out of curiosity, why are we using franchisee and other terminology? Would it not be simpler to use "Republic Services" or "Valley Landfills, Inc." throughout??

For example, if an expansion increases available airspace but intake volumes increase the fill rate even more, the overall life of the landfill could decrease.

LSCL-F-6: For purposes of this discussion, the subcommittee agreed to rely on data from the annual reports and other landfill filings with the county. EPA also provides data in their [GHG reporting webpage] that uses different data from another source. We do not know that source and the reasons for the disconnect between these two data sets.

LSCL-F-7: Factors such as population growth and debris from disasters may drive up intake rates and thus shorten landfill life; factors such as recycling and waste diversion, plus emerging factors such as extended producer responsibility (EPR) incentives and climate crisis legislation, may drive down intake rates and thus lengthen landfill life.

LSC F TBD: Landfill Life (longevity) is the availability of the landfill reserve resources and landfill ancillary resources that currently operates the landfill's demand, supply and equilibrium of refuse disposal in a linear economy model.

Landfill Size: Capacity

LSCL-F-8: A significant portion of the permitted capacity in the quarry area (Cell 6) is currently unavailable due to unexcavated rock. Permitted space is the physical volume available for the placement of solid waste. Benton County approves the land use for the landfill's footprint. However, DEQ and the franchisee (Valley Landfills Inc.), approve the cell design that determines the physical volume available. "Airspace" is the resulting volume left within the permitted space for the disposal of solid waste.

LSCL-F-9: Landfill total capacity increased by approximately 9,000,000 cubic yards in 2003 with the addition of the West and East triangle areas. The addition of Cell 6 (in TBD) added approximately 13,400,000 cubic yards, for a total of approximately 35,500,000 cubic yards. The formal approval of Cell 6 as a disposal area has not been identified or confirmed. **[REVIEW ACCURACY BASED ON BILL'S FEEDBACK]**

LSCL-F-10: Reported remaining airspace increased by over 6,000,000 Cubic Yards between 2003 and 2004. Since 2004, reported remaining airspace has decreased gradually, while total permitted airspace has remaining somewhat constant. As of end 2021 approximately 44% of permitted capacity remained unused.

Landfill Size: Intake Tonnage

LSCL-F-11: The amount of waste placed into the landfill has grown dramatically over the past 40 years. In 1983, 375 tons per day were placed into the landfill (117,000 tons per year). By 1993, the tonnage volume increased to 310,000 tons per year. In 2003 550,000 tons were placed into

Commented [RD24]: These are not necessarily "intake increasing factors", as established later in the document.

Commented [RG25]: This should be removed or rewritten as it does not match where we landed on Section 3.

Commented [RD26]: Added by Chuck 2.22.23

Commented [RG27]: Adding this as a proposed finding for the group's consideration. It is noted elsewhere in the body of Section 3.

Commented [YM28]: Different portions of the property have been designated as Cell 6 at separate times. So this needs to identify when Cell 6 was identified in the quarry location.

Commented [RD29R28]: From Paul: Date of formal approval of permitted space still needed.

the landfill. By 2013, the waste tonnage was 479,000, and in 2021, 1,046,000 tons were emplaced.

LSCL-F-12: The official 2022 Coffin Butte annual intake tonnage is not available at the time of this report (February 2023). The size of the Host Fee payment to Benton County in January 2023 indicates a 2022 intake volume of 1,066,436 Tons. The actual tonnage figure should be updated after the receipt of the 2022 Coffin Butte Landfill Annual Report.

LSCL-F-13: The 2000 Landfill Franchise Agreement stipulated that the County was to perform a “Baseline” study as a reference for measuring potential future adverse effects (completed in 2001), and defined a ramping intake tonnage threshold to be applied during the term of the agreement (CY2001-2019). Intake volumes in excess of this threshold granted the County clear right to pursue specific remedies: a) the County, at its expense, could perform an updated Baseline assessment, and b) if the County determined that the new assessment indicated an adverse impact on “the Baseline,” the agreement stipulated that “the parties shall immediately proceed in good faith to negotiate an increase in the Franchise Fee and/or Host Surcharge...”.

LSCL-F-14: The 2000 intake tonnage threshold was exceeded in calendar years 2017, 2018 and 2019.

LSCL-F-15: Washington County waste tonnage accepted at the landfill increased by over 400% between 2016-2017, with the increased tonnage continuing through 2019. Riverbend Landfill was a regional landfill that accepted waste from many counties, including Washington County. Tonnage from Riverbend was diverted to Coffin Butte in an effort to extend Riverbend’s site life.

LSCL-F-16: Benton County did not utilize either of the contractual remedies available to it as a result of the intake tonnage exceeding the threshold in 2017-2019. No updated Baseline study was performed, and no renegotiation of the landfill fee structure was undertaken.

LSCL-F-17: Benton County received approximately \$3.1M of incremental revenue from the increased intake volumes over the 2017-2019 period. Of this, approximately \$1.08M was the result of intake volume in excess of the annual limits over the three-year period. This equates to roughly \$11.50 total per Benton County resident for the three-year period.

LSCL-F-18: In an official 2018 presentation to Benton County Board of Commissioners, Benton County represented the 2000 Franchise Agreement intake threshold as “Annual Maximums Specified in Franchise Agreement.” However, the 2000 Franchise Agreement does not describe the tonnage threshold as a “limit” or “maximum” and does not limit the number of tons that can be accepted.

LSCL-F-19: Both the 2000 Landfill Franchise Agreement and the 2020 Landfill Franchise Agreement include a section stating that “The parties acknowledge that there may be adverse effects to the County’s infrastructure and environmental conditions due to increased annual volumes of Solid Waste accepted at the Landfill.” In both agreements this section of the agreement then stipulates terms regarding intake volumes.

Commented [PN30]: Reworded prior to Republic comments received 7Feb. Not updated with Republic’s suggested wording.

Commented [PN31]: I recommend this version as the most detailed and complete.

Commented [RD32]: Two findings from Paul

Commented [RG33]: Republic Services needs to check on this language.

Commented [RG34]: Added for context and clarity.

Commented [PN35]: This is explained in the text, but wording needs to be improved here for clarity.

Commented [PN36]: I believe we should keep this statement as documentation of what has been presented to the Commissioners on this subject. Other Findings edits make clear this is not a “limit.”

Commented [RD37R36]: I recommend that the group focus on clarifying the importance of this. Perhaps consider something like, “Some neighboring residents have been concerned about the exceedances of the 2000 tonnage threshold, because they considered the 2000 tonnage threshold as a maximum amount allowed, as communicated in an official 2018 presentation to Benton County Board of Commissioners, where Benton County represented the 2000 Franchise Agreement intake threshold as “Annual Maximums Specified in Franchise Agreement.” ”

Commented [RG38]: Added language.

Commented [PN39]: Reworded prior to Republic comments received 7Feb for LSCL-F-9. LSCL-F-9 has been deleted as a result of consolidation and rephrasing of other findings.

LSCL-F-20: The intake threshold defined in the 2000 Landfill Franchise Agreement and the Tonnage Cap defined in the 2020 Landfill Franchise Agreement were stipulated as contractual provisions, with consequences [reference other findings] explicitly defined in the 2000 agreement and implicit (violation of contract) consequences in the 2020 agreement.

Commented [RD40]: From Paul

Commented [YM41]: Not sure this is the right word for this sentence

LSCL-F-21: The 2020 Landfill Franchise Agreement defined a 2020 Tonnage Cap of 1.1 M Tons/year that the Landfill "shall not exceed." That includes 75,000 tons reserved annually for Benton County. The Tonnage Cap does not apply to fire, flood, natural disaster, or Force Majeure event materials.

LSCL-F-22: The 2020 Landfill Franchise Agreement also includes a provision that the tonnage cap would be eliminated upon a successful application to "expand the landfill onto the Expansion Parcel."

Commented [RD42]: From Paul: Propose delete.

LSCL-F-23: Some residents near the landfill are concerned that the landfill will accept more waste than the allowed Tonnage Cap of 1.1M tons, and are unsure if the 2020 Franchise Agreement's enforcement mechanisms will do enough to prevent agreement violations.

Commented [RD43]: Daniel added to capture this feedback from Paul. Paul, please review and let the group know if this does not accurately reflect your feedback, and edit or correct as needed.

LSCL-F-24: The landfill operator generally chooses how much tonnage to accept, based on demand and their contracts with various jurisdictions and haulers. Some of the increasing tonnage accepted at the landfill from 1993-2021 reflect the increase in business development.

Commented [PN44R43]: The statement is true but I'm not sure it warrants a Finding.

LSCL-F-25: The slow downward trend in intake volume in the 2006-2010 period is explained by the franchisee as resulting from the economic downturn of 2008.

LSCL-F-26: Republic Services states that the drop in volumes to Coffin Butte in 2020 is due to the global COVID-19 pandemic, coupled with diversion of tonnage from Riverbend Landfill to other landfills besides Coffin Butte. However, tonnage volumes increased again in 2021 due in part to changes in lifestyle/development/at home shopping patterns as a result of the pandemic, as well as debris from the Oregon wildfires.

Commented [YM45]: Again, no real data to support this claim. Also, it is interesting that there is no mention of Republic's efforts to gain additional contracts for hauling and disposal of trash from other counties and jurisdiction. It deliberately ignores the increased tonnage from those sources.

LSCL-F-27: A range of human factors have been seen to influence the landfill's intake rate and therefore its operating life in the past. These include business factors such as expansions or contractions of the Service Area, social factors such as recessions and population growth, and environmental factors such as recycling and other initiatives that divert materials out of the wastestream.

Commented [RG46]: Human factors are listed near the top of the findings and recommendations as well. Need to eliminate redundancies.

LSCL-F-28: More human factors are emerging that will influence the landfill's intake rate and therefore its operating life in the future. These include newly enacted state legislation assigning responsibility for disposal costs to the producers of waste material, newly enacted national legislation addressing food waste, and national legislation being rolled out that targets methane and other greenhouse gas pollution.

Commented [RD47R46]: Note: Comment applies to F-38 and F-39.

LSCL-F-29: A 2016 MOU between Benton County and Republic Services acknowledged "Coffin Butte Landfill will be accepting municipal solid waste currently being delivered to Waste Management's Riverbend Landfill for a term of 1-2 years, beginning in January of 2017."

Commented [RD48]: From Paul: Redundant with (c) above. Propose delete.

[LSCL-F-30](#): The 2016 MOU does not contain language preventing Benton County from exercising its rights under the 2000 Landfill Franchise Agreement (see Recommendations).

Specific Locations

[LSCL-F-31](#) : Valley Landfills Inc. anticipates it will no longer be able to place waste in Cell 5 by mid-year 2025. When Cell 5 is full, Republic Services is working on a contingency plan to deposit waste in the permitted area of the landfill known as the quarry known as Cell 6. Excavation of the primary quarry footprint is scheduled to begin in Spring of 2023 with completion in Spring 2025.

[LSCL-F-32](#): Approval of the 1983 rezoning was recommended by SWAC and CAC with on the condition that “No landfill be allowed on property south of Coffin Butte Road.”

[LSCL-F-33](#): The recommended condition prohibiting landfill south of Coffin Butte Road was not included in the 1983 rezoning ordinance through a change recommended by Benton County Staff, in which Staff noted that any new disposal area would require approval of the Planning Commission in a public vote. The process for approving landfill south of Coffin Butte Road was subsequently changed to “allowed by conditional use permit.” This appears to be done via Ord. 90-0069 (BCC 77.305) This change was memorialized in the 2002 Memorandum of Understanding executed by Valley Landfills and Benton County.

Commented [RD49]: From Paul

Commented [PN50]: Underline emphasis added (original text stated “eliminated”)

Commented [PN51]: Republic suggests alternate (milder) language here 7Feb, and notes memorialization of the CUP procedural requirement in the 2002 MOU. Needs discussion.

Commented [PN52]: Underline emphasis added (original text stated “eliminated”)

Commented [RG53]: Republic Services would like to add the language in red.

Landfill Size: Footprint and Structure

[LSCL-F-34](#): The 1983 rezoning action defined 194 acres as Landfill Size (LS) zone. An additional 56-acre parcel south of Coffin Butte Road, while zoned LS, would not be used for disposal of solid waste unless approved by a conditional use permit and Department of Environmental Quality permit for solid waste landfill use. The site map attached to the 2002 MOU restricted “fill” activity to the north side of Coffin Butte Road.

[LSCL-F-35](#): Twenty-three tax lots are owned by landfill-affiliated entities. Six of these taxlots are zoned LS, and the 5 LS tax lots on the north side of Coffin Butte Road contain landfill cell disposal areas. The most recent tax lots associated with the landfill were purchased in 2001 (non-disposal areas).

[LSCL-F-36](#): The landfill has changed visually over time. Coffin Butte Landfill has changed visually since it’s designation as a regional landfill in 1974, growing in both height and size. However, the overall landfill acreage, most notably permitted airspace, hasn’t changed significantly since 1983; it has filled in more of its footprint.

Commented [PN54]: Need something more definitive/meaningful here.

Commented [RG55R54]: Are we trying to say it’s grown or gotten taller? Republic Services is Ok with such phrasing. Made an attempt to address.

2 Table of Recommendations

Key Recommendations:

The A.1. Landfill Size, Capacity, and Longevity subcommittee proposes 8 recommendations as part of its overall charge. The committee is not in agreement on all findings, and the following findings have **NOT BEEN REVIEWED** by the full subcommittee. These recommendations do not represent consensus of the subcommittee, and they may be revised by the subcommittee further.

LSCL-R-1: The Sustainable Materials Management Plan should further develop scenarios and factors that may impact the landfill lifespan, including detailed analyses of likely projections.

Commented [RD56]: Notes from 2/23 WG Meeting:

- Crosswalk with SMMP subcommittee

LSCL-R-2: Benton County should create and share a plan for the enforcement of all franchise agreements, including the 2020 Landfill Franchise Agreement Tonnage Cap.

LSCL-R-3: Benton County shall conduct an updated Baseline Study to evaluate the impact of the current intake level at Coffin Butte. As with the 2001 Baseline Study stipulated in the 2000 Landfill Franchise Agreement, this study should determine and measure adverse effects, including but not limited to: traffic, soil conditions and contamination levels, air quality, surface and ground water conditions and contamination levels, noise, odor, visual screenings, litter, hours of operation, solid waste control systems and compliance with all solid waste Permits. The county should then use this information to inform decision-making and financial choices regarding income from the landfill franchise.

LSCL-R-4: The County should, as soon as possible, consider the public record of the deliberations leading to the execution of the 2020 Landfill Franchise Agreement in order to assess a) which party requested that the 2020 Tonnage Cap be eliminated if expansion was approved, b) if Benton County proposed the elimination of the 2020 Tonnage Cap, determine why this was done, c) determine the County's expectation for the benefit(s) to the County of accepting up to 1.1M Tons of waste per year when the County's reserve portion is approximately 6.8% of that amount, d) interpretation of the "Tonnage Cap", specifically relative to the 2020 Tonnage Cap, and e) expectations of both parties for future landfill site expansion, including any plans for multiple (repeated) future expansions. The county should then use this information to inform landfill-related decision-making.

LSCL-R-5: Benton County should clarify and document the process for officially establishing Permitted Space, including any and all required Benton County actions and regulatory agency approvals (ODEQ, EPA, etc.).

LSCL-R-6: The County should clarify when formal approval of Cell 6 as a disposal area was granted.

LSCL-R-7: The Benton County Solid Waste Advisory Council (SWAC) should review all future Coffin Butte Annual Reports relative to past reports and official approvals, in particular with regard to intake volume, landfill traffic volume (both Municipal Solid Waste and leachate transport), expected Landfill Life and EOL, and total and remaining Permitted Space. SWAC should report these findings to the BOC for consideration.

[LSCL-R-8](#): Benton County should secure information from Republic Services about the Annual Tonnage figures for presentation to SWAC/DSAC as soon as they are available, and not wait to include them for the first time in the Annual Report.

Executive Summary

[Landfill Life Projections](#)

A. Coffin Butte Site Life Projection: 2023 to closure

The landfill life projections shown below are provided Republic Services. They are designed to establish a baseline – a simple operational project that more sophisticated scenarios can be built upon.

It presumes:

- a) A steady annual tonnage intake of between 1 million and 1.1 million tons for the duration of the landfill’s projected remaining site life.
- b) Site life is currently projected by Republic Services to be between 14.5 and 16 years, with a closure date between 2037-2039.
 Note: This also presumes that the landfill area known as “the quarry” can be fully excavated. A significant portion of permitted airspace at Coffin Butte is currently unusable due to unexcavated rock.
- c) As indicated in the assumptions, this baseline is not a “default future,” in that it does not incorporate outside factors.

Scenario 1

Tons per Year	1,000,000 Tons
Projected Remaining Airspace 12/31/22	16,008,557 CY
2022 3-year Density Avg	0.999 Tons/CY
Site Life	15.99 Years

Scenario 2

Tons per Year	1,100,000 Tons
Projected Remaining Airspace 12/31/22	16,008,557 CY
2022 3-year Density Avg	0.999 Tons/CY
Site Life	14.54 Years

Definitions:

Tons per Year: Projected tonnage based off recent history*

Projected Remaining Airspace: Airspace remaining at the end of 2022 based off projected 2022 tons and 2022 3-year density average

2022 3-year Density Avg: Average density measured during 2020, 2021 and 2022 measurements

Site Life: Total site life including the fully excavated quarry area

*Variables can and do impact tonnage and available airspace, and can include changes in disposal and diversion rates, natural disasters and other unforeseen market changes, etc.

Commented [RD57]: From Paul: Suggest we just identify this as the formal baseline projection provided by the franchisee and eliminate the redundant versions below (P. 6 & 8).

Commented [RD58R57]: Done

The table shown above represents industry-accepted modeling for estimating a Landfill’s remaining life. Modeling is based on three factors: remaining permitted airspace, volume, and density. As noted in the text below the graphic, Republic Services acknowledges that a wide variety of variables, independently or in concert with each other, can impact the baseline(s) enumerated above.

Committee members also want to make clear that the two baseline scenarios shown in the graphic are built on certain assumptions. They are as follows:

- a) **Tons per year** – Projected tonnage based on recent history (2019-2021) and 2020 Franchise Agreement tonnage cap (1.1M tons/year). *Does not reflect variables such as changes in disposal and diversion rates, natural disasters, market, and regulatory changes, etc.*
- b) **Projected remaining airspace** – Airspace consumed in 2022 based on projected 2022 tonnage and the three-year density average. *“Remaining airspace” includes approximately 2.7M cubic yards of quarry rock; how much of and by when this rock can be converted to airspace is currently unknown. Quarry extraction in 2022 freed up approximately 140,000 cubic yards.*
- c) **2022, three-year-density average** – Derived from 2020-22 measurements. 2022 density based on 2021 measurements.
- d) **Site Life** – Time to fill the projected remaining airspace, *including the permitted airspace that is currently unexcavated.*
- e) **Landfill Life** is the availability of landfill reserves and landfill alternatives that sustains the landfill’s demand, supply and equilibrium of refuse disposal.

Commented [RG59]: All text here verbatim from Ken’s explanatory text on the revised graphic in the original document. Trying to avoid having the graphic in there twice as it’s currently listed.

Commented [RD60]: From Chuck - 2/15 email, added here instead of beneath the heading "A" above.

Coffin Butte: Site Life Scenarios

Positive

A recession
 Landfill expansion (CUP)
 Less waste per capita
 Transfer station/disposal alternatives
 Global health issues (pandemic)

Neutral

Legislation
 Legal action
 Climate change
 Activism
 Quarry excavation (pandemic)

Negative

Remove of tonnage cap
 Wildfires/natural disasters
 Impacts/closures of other landfills
 Population growth

* Projected remaining site life could increase or decrease depending on a variety of factors. The “positive” category refers to dynamics that could increase site life. The “negative” category refers to those that could reduce or shorten site life. “Neutral” refers to those factors that will not have an impact or where there is not enough information available to predict impact.

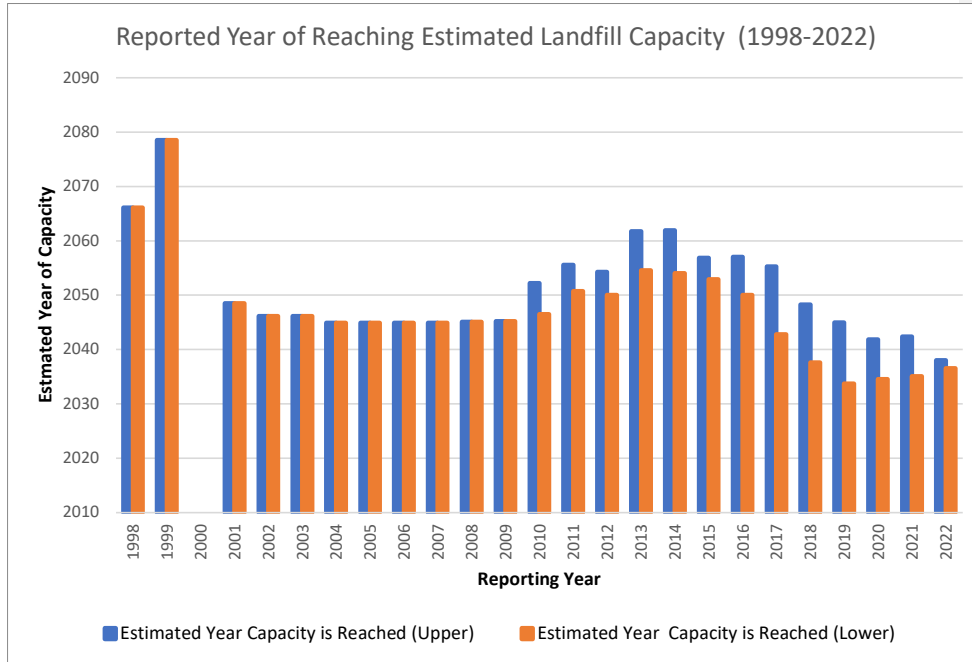

The chart above, submitted by Republic Services, lists factors and elements that could impact Coffin Butte’s site life in ways not foreseen in the baseline (Scenario 1 and 2) approach outlined above. The subcommittee believes that it’s likely that one or more of these factors could occur in concert with each other.

Commented [RG61]: Added per Paul’s suggestion.

Commented [RG62]: These paragraphs are from Chuck. I did attempt to pare them down, but if I mischaracterized anything, I am happy to make adjustments. I also believe Chuck wanted to craft a “finding” out of this section and am open to that as well.

B. Historical Landfill Life Projections

Figure 1: Historical EOL Projections (source: [Landfill Annual Reports](#))

Commented [RD63]: We already have modern data for reported site life from Landfill annual reports, which I recommend using instead of EPA data for consistency with the rest of the document. This table should probably focus on adding historical data points prior to that available in the landfill annual reports.

Recent intake volume: 1993 – 2021

Chart 2: Coffin Butte Landfill Intake 1993 - 2021

i. Intake volume by source 2016 – 2021

See chart below for a breakdown of the Coffin Butte intake by source county for the period 2013-2021. This period includes the significant intake volume increase of 2016-2017. The intake shown for Benton County includes the volume of the landfill’s daily cover, the soil used to overlay waste at the end of each day.

Commented [SM64]: Addition from Ken Eklund.

Figure 2: Intake by Source, 2013 - 2021

Section 1: Landfill Size

Physical Real Estate Footprint

i. History

The Coffin Butte landfill was initiated in the early World War II era as a local burn dump for the Adair Air Force Base. The location was chosen because it was convenient to the Base, and was not necessarily the result of a careful selection and evaluation process.

Per the 2002 MOU [Benton County & Valley Landfills MOU Relating to Land Use Issues \(2002\)](#):

- History prior to 1974 in progress
- 1974 CUP approved landfill activities on 184 acres north of Coffin Butte Road.
- 1983 rezoning added 10 acres for landfill activities north of Coffin Butte Road, for a total of 194 acres.
- The site map included in the 1983 rezoning consideration restricted “fill” activity to the north side of Coffin Butte Road.
- Since 1983, the total acreage of the permitted landfill site has remained largely unchanged.
- Franchisee (VLI) agrees that the approximately 56-acre parcel south of Coffin Butte Road, while zoned Landfill Site (LS), would not be used for disposal of solid waste unless approved by a conditional use permit and Department of Environmental Quality permit for solid waste landfill use.
- Total acreage owned by landfill franchisee unstated.

DANIEL: Do you have any historical data on this?

See Section 2 of this document for additional detail on land use and zoning actions impacting the landfill.

Commented [PN65]: Daniel: What is the source for this language? The 1983 rezoning Staff Report appears to state “...no additional landfill activities unless approved by the Planning Commission at a public hearing.”

Commented [RD66R65]: Chapter 77.305

Commented [RG67]: Since 1983, the total acreage of the permitted landfill site has remained largely unchanged.

Commented [RD68R67]: Added

Commented [YM69]: Any progress on this? Again, it is important to go back in time before 1974.

Commented [RD70R69]: I don't have any pre-1974 data on footprint/acreage.

Images

ii. Images

Figure 31: Reported circa 1941 aerial view of Coffin Butte area, before Camp Adair.

Figure 1: Reported circa 1941 aerial view of Coffin Butte area, before Camp Adair.

Commented [RD71]: Perhaps use google earth to compare similar perspectives in next draft.

Commented [RD72R71]: Done, added several aerial images provided by Paul.

Commented [73]: These images are good for historical context and should be retained.

Figure 2: Wide aerial view dated 6-10-63 (1963). Pond on south side of Coffin Butte was a result of military quarry operation.

Figure 3: Reported 1978 image of vehicles in line at the landfill.

Figure 4: 2008 aerial view, from the 2008 Coffin Butte Landfill Annual Report, Republic Services, Inc.

Figure 42: Aerial image from Fall 2022

ii.iii. Current footprint

The real estate footprint of the landfill is shown in **Error! Reference source not found.**, and **Error! Reference source not found.**, below. See Appendix C for a detailed table of landfill property by taxlot.

Figure 53: Properties associated with the landfill, numbered in coordination with the table in Appendix C, and color-coded by zoning.

Figure 64: Property map, with years each property was purchased by a landfill-affiliated organization

Note: Properties zoned LS (specifically #5, 7, 8 and 14) were likely purchased by landfill owners prior to 1983, but at the time of this report that property ownership information was not available, and only the more recent property records shown above were available.

Permitted Disposal Capacity

iii.iv. Historical permitted capacity benchmarks

The following table lists total expected/calculated permitted capacity for selected points in time. Note that before approximately CY 2000 the Coffin Butte annual reports are inconsistent in presenting an estimate of this capacity; thus historical figures (e.g. 1983) are typically derived from a combination of archival data. For all but the latest figure (CY 2021), the figures should be interpreted as rough estimates and not precise volume numbers. The intent of providing the historical numbers is to document the growth of the expected/planned landfill size over time.

Commented [RD74]: It is unclear what capacity information is included in these Site Development Plan (SDP) snapshots of data, and it might not be helpful to compare these as "benchmarks" from year-to-year. The annual reports probably have the most helpful total capacity data available, while the SDP capacity information seems to only relate to the volumes associated with planned development at that point in time.

Commented [RD75R74]: Suggestion from the group to use historical lifespan projections documented over time, instead of permitted capacity, due to lack of information/data available on permitted capacity prior to 2004.

Table 1: Historical Capacity Values

Date	Total Capacity (yd ³)	Notes
1983	13,134,000	Capacities defined in the 2003 Site Development Plan for the cells ultimately located on the fill areas shown in <i>Error! Reference source not found.</i> areas (Cells 2-5)
2003	22,134,000	Addition of West and East triangles (3,400,000 yd ³ and 5,600,000 yd ³ respectively); calculated from 2003 Site Development plan 1999 cell volume figures
?	35,531,000	With Cell 6, <u>estimated at 13,397,000 yd³</u>
1995	18,000,000	1995 Annual Report, estimated total capacity of Cells 1-5
2003	35,531,000	2003 Site Development Plan, based on October 1999 cell volumes and adding West and East triangles, with Cell 6 <u>estimated at 13,397,000 yd³</u>
2004	39,594,002	2004 Coffin Butte Landfill Annual Report
2013	39,172,992	2013 Coffin Butte Landfill Annual Report
2021	38,997,848	2021 Coffin Butte Landfill Annual Report

Commented [RD76]: Consult DEQ permit documents.

Commented [PN77]: If Republic Services would like to include Cell 1 volume for completeness, please supply the volume figure for that cell.

Commented [PN78]: Still looking for date and instrument granting formal county approval of Cell 6 permitted space

Commented [PN79]: Daniel: when was the addition of Cell 6 formally approved by the county?

Commented [RD80R79]: Daniel will look in to this. Ian said it was approved via 1983 site zoning. 1994 expansion application can be confusing.

Commented [RD81R79]: Cell 6 development plans may still need to be approved by the Planning Official. Daniel is researching further.

Commented [RG82]: Per Ian Macnab: Need clarity on where this number came from? "I can't find anything regarding the 1995 number. I only can find annual reports going back to 2003 and the annual reports only started listing total capacity in 2004."

Commented [RD83R82]: This number came from a set SWAC minutes attached to the 1995 annual report (generated by Benton County Staff), where Valley Landfills included 18,000,000 tons as a line in a chart, referenced as total site capacity (not permitted/planned capacity).

Commented [RD84]: Perhaps use anticipated closure dates over time

Commented [RG85]: We need to reconcile the numbers in this chart. The annual report in 2004 lists total capacity as 39,594,002.

iv.v. Capacity utilization 2001 – 2021

The plot below shows the total permitted airspace and the available (remaining) airspace over the period 2001 – 2021. Note that as of end 2021 approximately 44% of the total permitted capacity remained unused.

Chart 1: Coffin Butte Airspace Total/Remaining 2001 - 2021

Near-term (circa 2025) capacity adjustments for 5-year operating plan

Provide simple overview of Cell 5 -> Cell 6 transition issue in terms that can be understood by the general public. State that as of the time of this report (Q4 2022) potential solutions are being explored? Note this as the driving factor in landfill's prior conditional use permit application to expand, LU21-047, which the Planning Commission denied, and the applicant's appeal was withdrawn in March 2022047?

REPUBLIC SERVICES: guidance/input on phrasing and/or extent to which this should be flagged as an issue.

Republic Services is currently in discussion with both Knife River and Benton County regarding necessary permitting/steps to begin excavation of the quarry (future cell 6).

Clarify language on quarry excavation. In progress.

Intake Volume

Coffin Butte intake volume is documented in the annual reports produced by the landfill franchisee. Benton County has annual reports on file for years 1993 – 2021 (inclusive) with the exception of year 2000; intake data for 2000 is available in the 2021 report. Note that with older (pre-2008) reports, the annual intake volume figure is sometimes difficult to determine precisely due to inconsistent values stated within a given annual report (e.g. narrative summary vs. intake volume table) and/or discrepancies in values referenced in subsequent annual reports (e.g. historical comparisons). Where discrepancies exist within a given annual report, the figure documented in the intake volume table is used. See Appendix A for a detailed listing of the annual intake volumes used in this document.

ii. **2000 and 2020 Landfill Franchise Agreement Intake Thresholds Limits**

New wording in this section - needs review by A.1 team – Paul Nietfeld 14Feb2023

Commented [RG86]: Perhaps note, for clarity, that this document is our prior CUP application, which was withdrawn in March 2022. NOTE: I NEED TO STILL WRITE/WORK ON BROADER OVERVIEW LANGUAGE

Commented [RD87R86]: Added temporary clarifying details

Commented [RG88]: I think this will be updated in the coming weeks. Perhaps we should say for now that "Republic Services is currently in discussion with both Knife River and Benton County regarding necessary permitting/steps to begin excavation of the quarry (future cell 6).

Commented [KE90]: In a recent report to the BoC, Darren Nichols heard this characterization and responded that the County has not been engaged in any discussion. So maybe delete the mention of Benton County for now.

I agree that we do have to come up with interim language to summarize the negotiations-in-process, as it seems unlikely to be resolved before our document is due

Commented [YM92]: Not sure what this is intended to mean - they are and have been excavating the quarry for many years. What is different now?

Commented [RD93]: Scale weight, tonnage may be better

Commented [94]: I think the text in this subsection lays out the similarities and differences between the two FA limits very well.

Commented [RD95]: From Paul: I now agree the 2000 boundary was not stated as a limit per se, but it was clearly identified as a threshold, that, if exceeded, granted the county clear right to pursue specific remedies (launching a new Baseline assessment, reopening negotiations on the Franchise and/or Host fees if the County determined that the updated Baseline study indicated "adverse impact").

Commented [RD96R95]: From Paul: I believe the 2000 "threshold" was clearly exceeded in 2017-2019. I believe Benton County utilized none of the contractual remedies available to it as a result of these "exceedances." We agreed it is fair to note these concerns in Findings and Recommendations.

Commented [RD97]: This section should be re-titled as to not mislead readers into thinking that the "limits" in the 2000 and 2020 Franchise agreement are similar, because they are completely different and unique concepts.

Definitions

2000 Landfill Franchise Agreement: The 2000 Landfill Franchise Agreement between Benton County and Valley Landfills Inc., signed December 31, 2000 and effective from December 31, 2000 until December 31, 2020.

2000 Intake Threshold: The intake tonnage level specified mathematically in the 2000 Landfill Franchise Agreement. If the volume of solid waste accepted at the landfill in any calendar year exceeded this annual level, or if the cumulative volume of solid waste accepted at the landfill in any two consecutive calendar years exceeded the two-year level, the County was allowed, at its expense, to perform a new Baseline assessment, and if the County determined this assessment indicated an adverse impact relative to the 2001 Baseline Study an immediate renegotiation of the Franchise Fee and/or Host Surcharge was required.

2001 Baseline Study: The assessment of environmental and infrastructure conditions and areas of potential impacts from the volume of solid waste accepted at the landfill, as mandated in the 2000 Landfill Franchise Agreement. This assessment was completed by the Benton County Health Department with results documented in a report released in 2001. This study included the following elements: Traffic, Soil Conditions and Contamination Levels, Air Quality, Surface and Groundwater Conditions and Contamination Levels, Noise, Odor, Visual Screening, Litter, Hours of Operation, Solid Waste Control Systems and Compliance with all Solid Waste Permits.

2020 Landfill Franchise Agreement: The 2020 Landfill Franchise Agreement between Benton County and Valley Landfills Inc., signed December 21, 2020 and effective from January 1, 2021 until December 31, 2040.

2020 Intake Limit: The 1.1 M Tons/year “Limit on Solid Waste” defined in the 2020 Landfill Franchise Agreement, in place until “Franchisee’s governmental applications to expand the landfill onto the Expansion Parcel are granted” and stipulated as the level which the total tonnage of solid waste deposited by the franchisee “shall not exceed” during any calendar year, with exceptions for fire, flood, other natural disaster or any Force Majeure event.

Agreement Terms

Both the 2000 Landfill Franchise Agreement and the 2020 Landfill Franchise Agreement include a section with the stipulation “The parties acknowledge that there may be adverse effects to the County’s infrastructure and environmental conditions due to increased annual volumes of Solid Waste accepted at the Landfill.” In both agreements this section of the agreement then stipulates terms regarding intake volumes.

The 2000 Landfill Franchise Agreement mandated that the County was to perform a “Baseline” study as a reference for measuring potential future adverse effects (completed in 2001), and defined a ramping intake tonnage threshold to be applied during the term of the agreement (CY2001-2019). See Appendix A for a detailed calculation of the annual values of this threshold. In this document the threshold thus defined is termed the “2000 Intake

Threshold.” Intake volumes in excess of this threshold granted the County clear right to pursue specific remedies: a) the County, at its expense, could perform an updated Baseline assessment, and b) if the County determined that the new assessment indicated an adverse impact on “the Baseline,” the “parties [Benton County and the franchisee] shall immediately proceed in good faith to negotiate an increase in the Franchise Fee and/or Host Surcharge...”.

While the 2000 Landfill Franchise Agreement did not refer to the intake threshold as a “limit,” in a presentation compiled by the Benton County Health Department for consideration at the September 4, 2018 Benton County Board of Commissioners meeting the 2000 agreement intake threshold was described in a key chart as “Annual Maximums Specified in Franchise Agreement”; see Page 33 of the *BentonCountyBoardofCommissionersMeeting_4Sep20189_180904_tu_pkt.pdf* document.

The 2020 Landfill Franchise Agreement stipulates that the total tonnage deposited at the Landfill “shall not exceed” 1.1M Tons per calendar year (described as the “Limit on Solid Waste) until “applications to expand the Landfill onto the Expansion Parcel are granted (following any and all appeals to final judgement).” Of this 1.1 M Tons per year, 75,000 Tons per year were reserved for Solid Waste from the County exclusively, with the balance of 1.025 M Tons per year being termed the “Tonnage Cap.” It was stipulated that “The County agrees that the Tonnage Cap shall not apply to any Solid Waste generated from fire, flood, other natural disaster or any Force Majeure event.” In this document the “shall not exceed” limit of 1.1 M tons per year is termed the “2020 Intake Limit.” To avoid confusion, wherever practical in this document the “2020 Intake Limit” will be referenced as the governing intake limit and use of the term “Tonnage Cap” will be avoided.

Recent intake volume: 1993 – 2021

iii.

Annual intake volume for 1993 – 2021 is shown in Figure 2.

Chart 2: Coffin Butte Landfill Intake 1993 - 2021

Commented [RD98]: The 2000 Franchise Agreement did not have a "limit", so the blue line is not accurate.

This annual tonnage does not match the data from the landfill annual reports for many of the years, so I recommend using the landfill annual report data for consistency (as shown in the suggested chart below).

"Intake Volume" may be misleading for this chart, as tonnage and volume are distinct concepts with landfill operations. I recommend a label like "Annual Tons Accepted" for clarity.

Commented [KE99]: From our conversations, the issue with the 2000 FA line and the 2020 FA line is that they both are characterized by the word "limit," but what they limit are each different. Perhaps the best resolution for this is to use the word "cap" instead of limit for the label on the 2020 FA line, since that is the word actually used in that Agreement.

Commented [RD100R99]: I understand the issue to be the confusion caused by word choice, which is not clarified through replacing "limit" with "cap", which will generally mean the same thing to most readers. Providing more detail in these titles will help provide clarification, perhaps using titles like "Threshold to update Baseline Study" to replace "2000 FA limit".

Commented [RD101]: The 2000 Franchise Agreement did not have a "limit", so the blue line is not accurate.

This annual tonnage does not match the data from the landfill annual reports for many of the years, so I recommend using the landfill annual report data for consistency (as shown in the suggested chart below).

"Intake Volume" may be misleading for this chart, as tonnage and volume are distinct concepts with landfill operations. I recommend a label like "Annual Tons Accepted" for clarity.

Commented [RD102R101]: Daniel, Paul, and Mark are working on options for rewording the legend. Paul and Daniel verified annual tonnage data, based on data in the tonnage charts of landfill annual reports (instead of the narrative). Paul used 2% annual increases in the 2000 FA reference line, as that was larger than population growth.

iii.iv. Comments/discussion:

1. The landfill operator generally chooses how much tonnage to accept, based on demand and their contracts with various jurisdictions and haulers. Some of the increasing tonnage accepted at the landfill from 1993-2021 reflect the increase in business development.
2. The annual Coffin Butte intake tonnage exceeded the 2000 Intake Threshold in calendar years 2017, 2018, and 2019 (see Appendix A for exact figures). The County did not perform an updated impact assessment as a result of the 2017-2019 tonnage threshold exceedances and no fee increase negotiation was undertaken.
3. Due to an expected additional influx of volume in 2017 resulting from the onset of the closure process for Riverbend landfill in Yamhill County, in December 2016 the franchisee and Benton County executed a MOU ([Benton County & Republic Services MOU Relating to Additional Tonnage \(2016\)](#)) acknowledging an expected increase in Coffin Butte intake volume “for a term of 1-2 years.”

In Progress – Need to determine accurate characterization of what happened with Riverbend Landfill

4. In documents provided to the A.1 Subcommittee, representatives of the franchisee have indicated that the approximately 70.25% year-over-year increase in CY2016-2017 was primarily due to redirected flow from Riverbend to Coffin Butte. According to the franchisee, 2017-2019 volume increases are primarily due to the diversion of waste from Riverbend Landfill, “in an effort to extend landfill life,” and also rapid population growth in Willamette Valley and Western Oregon. Note that data from the Portland State University Population Center (referenced in the 2000 Landfill Franchise Agreement as the reference source for the population data to be

Commented [KE103]: This is not an accurate characterization of what happened. Riverbend Landfill attempted to expand but could not, so it closed as scheduled.

Commented [PN104]: As Ed Pitera pointed out in the 15Dec2022 Workgroup meeting, this MOU was an “acknowledgement” of expected 1-2 year intake increase, rather than an “agreement.”

Commented [YM105]: Has anyone looked closely at the numbers to actually determine how much of the increased volume was due to redirected waste flow from Riverbend closure and how much was due to Republic's efforts to develop new customers and contracts to haul waste to Coffin Butte? I am not sure that it is accurate to assign all the increased tonnage to Riverbend closure.

Commented [RG106]: 2017-2019 volume increases are primarily due to the diversion of waste from Riverbend Landfill, in an effort to extend landfill life, and also rapid population growth in Willamette Valley and Western Oregon.

Commented [RD107R106]: Added

Commented [YM108]: This phrase does not make any sense in this sentence. What is the intention of this statement?

Commented [YM109]: Some reference to additional Republic's efforts to broaden their landfill customer base needs to be included here.

used for calculating the 2000 Intake Limit) indicates the population of the 6-county service area defined in the 2000 Landfill Franchise Agreement grew 3.6% total in the period 2016-2019 (see Appendix A for population data).

5. The slow downward trend in intake volume in the 2006-2010 period is explained by the franchisee as resulting from the economic downturn of 2008.

Work In Progress – Explaining 2008 recession related intake

6. The drop in volumes to Coffin Butte in 2020 is due to the global COVID-19 pandemic, coupled with diversion of tonnage from Riverbend Landfill to other landfills besides Coffin Butte. However, tonnage volumes increased again in 2021 due in part to changes in lifestyle/development/at home shopping patterns as a result of the pandemic, as well as debris from the Oregon wildfires.

7. The 2021 fire debris volume accepted at Coffin Butte is reported by the franchisee as TBD tons.

8. Benton County received approximately \$3.1M of incremental revenue from the increased intake volumes over the 2017-2019 period (approximately 450,000 additional Tons/year @ \$2.31/Ton x 3 years). Of this, approximately \$1.08M was the result of volumes in excess of the intake limit over the three-year period (see yearly overage figures in Appendix A; total = 466,479 Tons @ 2.31/Ton). This equates to roughly \$11.50 total per Benton County resident for the three-year period.

In Progress – Add source/reference for data

9. A clear understanding of the intent of language in the 2020 Franchise Agreement is necessary for a thorough interpretation of this document regarding questions such as the setting of the 1.1 M Tons/yr. intake limit relative to the expected life of the landfill over the term of the agreement, the proper interpretation of the “Tonnage Cap” term, stipulations that bear on questions of allowed intake capacity relative to expected landfill life, and the parties’ expectations of landfill expansion. To that end, release by Benton County of all available public records related to the negotiation of this agreement is necessary for proper consideration of these issues by this subcommittee and the larger workgroup.

Commented [PN110]: Added detail on actual population increase.

Commented [KE111]: It is unclear to me how the crash of 2008 can be responsible for a downturn that began in 2006. Let’s look at other explanations, such as the rise of environmental awareness that played a key role in the 2008 election.

Commented [RG112]: There’s a typo here (should the first part of this sentence be 2007-2012, or should the second part of the sentence be 2018?

We CAN say that: The drop in volumes to Coffin Butte in 2020 is due to the global COVID-19 pandemic, coupled with diversion of tonnage from Riverbend Landfill to other landfills besides Coffin Butte. However, tonnage volumes increased again in 2021 due in part to changes in lifestyle/development/at home shopping patterns as a result of the pandemic, as well as debris from the Oregon wildfires.

Commented [RD113R112]: Updated to 2006-2010.

Commented [RD114R112]: Added detail to #7, with a strikethrough on previous text.

Commented [YM115]: In addition, Republic Services has been expanding their landfill customer base and, as a result, more waste is being transported to Coffin Butte.

Commented [PN116]: Need fire debris volume number here.

Commented [RD117]: This calculation, and source material should be referenced in its own appendix. Paul, can you please put that together?

iv.v. Intake volume by source 2016 – 2021

See chart below for a breakdown of the Coffin Butte intake by source county for the period 2013-2021. This period includes the significant intake volume increase of 2016-2017.

Figure 7: Intake by Source, 2013 - 2021

Long-term intake volume TBD – 2021

A long-term intake volume plot (from circa early 1980s to present) may be useful, in keeping with the “chronological history” aspect of the A.1 charge, and this could provide useful perspective for all concerned. For reference, in the approximately 80 years of landfill activity to date, 21,389,767 yd³ have been consumed per the 2021 annual report, for an average volume of about 267,000 yd³ per year.

This plot will require intake volume data and/or estimates that predate the available annual reports. Paul to investigate; any data input from others would be welcome.

Commented [RG118]: Republic Services certainly understands the intent of this intake volume plot, but warns that historical records are both limited and potentially inaccurate.

Landfill Structure

vi. Overview

The disposal area and surrounding lots are shown in **Error! Reference source not found.** below. This drawing is reproduced from the 2021 Site Development Plan, Appendix A, Drawing No. G03, and is reproduced here for convenience.

Drawing below imported from pdf; quality degraded. Better means of importing into Word?

Commented [RD119]: I suggest adding the high quality PDFs for each image in the final draft PDF version of this report.

vii. Cell detail

Detail on individual disposal cells and the active dates for these cells is shown in **Error! Reference source not found.** below. Dates are summarized in the following table.

Table 2: Cell Open/Closed Detail

Area	Date Opened	Date Capped/Closed
Closed Landfill (Burn Dump)	1940's	
Cell 1	Late 1970's	
Cell 1A	Late 1970's	
Cell 2A	1988	
Cell 2B	1994	
Cell 2C	1995	
Cell 2D	1998	
Cell 3A	2003	
Cell 3B	2004	
Cell 3C	2005	
Cell 3D Phase I	2007	
Cell 3D Phase 2	2009	
Cell 4	2012	
Cell 5A	2014	
Cell 5B	2018	
Cell 5C	2020	
Cell 5D	2022	
Cell 5E	Future	
Cell 6 (Quarry Area)	Future	

Commented [PN120]: This is the chart supplied by Ian M. on 11Nov2022. I have requested cell closure dates (Nietfeld email of 7Jan2023 to Ian M., Ginger R., Bill B.)

Commented [RD121R120]: Closure dates can be complicated. Burn dump no longer has closure date due to move to Cell 6. Final Cap might be better terminology. Only Cell 1 and 1A has been fully closed (in the 1990s). Final cap areas that exist might only be for part of the cell, because they are tied to other cells (2, 2b, cell areas along Coffin Butte Road). Request for Ian/Ginger to add verbiage.

Section 2: Specific Locations

This section summarizes the primary actions and events that define the current Coffin Butte landfill footprint.

A. 1983 Rezoning Action

Per Benton County PC-83-07-C, in 1983 a new zoning category (“LANDFILL SITE”) was created for Benton County. Approximately 266 acres of land owned by Valley Landfill, Inc. were rezoned with this classification. Of these 266 acres, 194 acres, all on the north side of Coffin Butte Road, were approved for waste disposal. The acreage on the south side of Coffin Butte Road can be permitted for waste disposal if a CUP is obtained from Benton County.

At the time the application for a zone change was filed in 1983, the landfill was receiving “approximately 375 tons of refuse per day” per PC-83-07 applicant filing.

Error! Reference source not found. denotes the originally proposed outline for land to be rezoned as Landfill Site (LS). Note that the northernmost section of the proposed area, extending north from the ridgeline of Coffin Butte, was ultimately not rezoned as LS due to concerns from neighbors. Also note that the expected areas of landfill are delineated in this drawing: Completed fill (west side), Present fill (southwest section), and Future fill (large area in center/east).

The overview map included in the [Benton County & Valley Landfills MOU Relating to Land Use Issues \(2002\)](#) document, included here as **Error! Reference source not found.**, clarifies the zoning boundaries.

Commented [RG122]: The acreage on the south side of Coffin Butte Road can be permitted for waste disposal if a CUP is obtained from Benton County.

Commented [RD123]: Comment from Chuck in response to Paul's comments: it would be good to have the legal sub-committee weigh in, since the 1983 rezoning appears to imply that a conditional land use action was made, but it also appears no landfill permit was granted by DEQ.

Therefore if true, would the land action default the land then to the Coffin Butte Disposal Site instead?

Commented [RG124]: The acreage on the south side of Coffin Butte Road can be permitted for waste disposal if a CUP is obtained from Benton County.

Commented [RD125R124]: Added

Figure 10: Proposed 1983 Rezoning Map

C. Cell 6 (Quarry) Addition

Need information from Benton County regarding the instrument formally approving Cell 6.

D. LS Zone Parcel South of Coffin Butte Road

As part of the 1983 action considering the requests for rezoning of several parcels from Forest Conservation to Landfill Site, the Benton County Planning Department submitted a Staff Report. Within this report (Staff Report P2361/7 Page 3; Benton County document PC-83-07 Page 13) a Staff Comments section noted

“Benton County Solid Waste Advisory Council recommended approval of the requests [for rezoning] subject to two conditions:

1. No landfill be allowed on north face of Coffin Butte.
2. No landfill be allowed on property south of Coffin Butte Road [Taxlot 104180001107, Index 14 in Appendix C].

These two conditions were also requested by the North Benton Citizens Advisory Committee (CAC) and they recommended approval of the requests.

Staff concurs with these conditions. The property on the North face of Coffin Butte (approximately 30 acres) should remain under the Comprehensive Plan Designation of Forestry Conservation (FC), from the crest of the butte North.”

However, the Benton County Planning Department Staff Report went on to state

“The other issue concerning the property south of Coffin Butte Road can be resolved through Conditions of Development placed on any approval of the site plan by the Planning Commission. The proposed zone allows no additional landfill activities unless approved by the Planning Commission at a public hearing. Therefore, the Commission may limit expansion into any area that is not appropriate for a landfill.”

The staff recommendation was adopted as submitted by the Planning Commission in their April 26, 1983 meeting. The Staff Report was expressly adopted as Finding 4(a) by the Benton County Board of Commissioners and incorporated into the resulting Order on June 15, 1983.

The recommended approval of both SWAC and CAC for the 1983 rezoning action was conditioned on the agreement that no landfill would be allowed on the parcel south of Coffin Butte Road (Taxlot 104180001107, Index #14 in Appendix C).

Thus, Benton County Planning staff modified the clear recommendation from the Solid Waste Advisory Council (SWAC) and the recommendation of the North Benton Citizens Advisory Committee by weakening the terms governing the property south of Coffin Butte Road from “No landfill be allowed” to “...no additional landfill activities unless approved by the Planning Commission at a public hearing.”

Commented [PN126]: Daniel: Is the Staff Report that is included in PC-83-07 (pages 11-30) the official, final released version?

Commented [RD127R126]: I believe so.

Commented [RD128]: These are recommendations only, those bodies to not provide "approvals"

The 1983 rezoning ordinance (Ord. 261) stated that “Any proposal to expand the area approved for landfill must be reviewed and approved by the Planning Commission at a Public Hearing.” No mention of a Conditional Use Permit process was stated in this ordinance as part of the process for expanding landfill area.

Per the Benton County Code Chapter 77 (77.305), “Any proposal to expand the area approved for landfill within the Landfill Size Zone is allowed by conditional use permit approved by the Planning Commission.” This change is apparently a result of Ord. 90-0069. The introduction of the conditional use permit process allows review and/or de novo judgement by the Board of Commissioners, as opposed to a final decision by the Planning Commission.

Commented [RD129]: Added at request of Paul to replace the deleted section above: The approval of both SWAC and CAC for the 1983 rezoning action was conditioned on the agreement that no landfill would be allowed on the parcel south of Coffin Butte Road. Additionally, per the Board of Commissioners Order of June 15, 1983, approval of additional landfill activities on the LS-zoned parcel south of Coffin Butte Road (Taxlot 104180001107, Index #14 in Appendix C) requires only 1) approval of the site plan by the Planning Commission and 2) approval by the Planning Commission at a public hearing.

Section 3: Landfill Life Projections

A. Waste in Place: Projection to End 2022

Coffin Butte Landfill’s 2022 intake volume has not yet been finalized, so we are using the projected figure of 1 million tons. As such, we are projecting the Landfill’s remaining permitted airspace to be 16,008,557 cubic yards. As noted in the subcommittee’s findings, remaining permitted airspace is not available airspace. A significant portion of what’s permitted is not currently useable to unexcavated rock.

This section of the report will first look at historical end of life projections and then try to address future scenarios.

Commented [RD130]: Addition from Ken Eklund

Commented [RD131]: From Ginger

B. Historical Landfill Life Projections

Figure 12: Historical EOL Projections (source: [Landfill Annual Reports](#))

Commented [RD132]: We already have modern data for reported site life from Landfill annual reports, which I recommend using instead of EPA data for consistency with the rest of the document. This table should probably focus on adding historical data points prior to that available in the landfill annual reports.

Table 3: Historical EOL Projections

Date of Projection	Projected EOL (CY)	Reference/Comment
--------------------	--------------------	-------------------

1974	1989-2004+	February 19, 1974 Planning Commission Public Hearing Minutes (CP-74-01) 15-30 or more years estimated from 1974.
1974	1994	March 1, 1974 Letter from Chemeketa Region Solid Waste Management Program Director (CP-74-01) Based on 1,759,831 total tons received, at 32-40 feet, with Sweet Home and Lebanon area wastes directed towards "Lebanon Landfill"
1977	2000	WCSI Solid Waste Management Plan (1977)
1983	2033	March 7, 1983 Memo from Benton County Development Director to BOC (L-83-07) 50 years from 1983 estimated with approval of zoning change (estimate may include property South or Coffin Butte Road, the information was unclear).
1994	2024-2034	"Summary of Written Comments Received from Citizens Regarding Coffin Butte Zone Change Request" Prepared by Benton County Environmental Health Division for a 11/29/10994 community meeting (PC-94-10) 30-40 years from 1994. Estimate using only property North of coffin Butte Road, assuming material from current counties at the time.
1999	Late 2070	2003 Site Development Plan, Page 57, Table 3.1 71.1 Years from Oct 1999 Includes Cells 1-6 and East and West Triangles Based on 400,000 Tons/year and 0.8 Tons/yd ³
2001	2049	2001 Annual Report, prior to addition of East and West Triangles and Cell 6

Commented [133]:
I remember seeing reference to an earlier report which gave the landfill EOL as the year 2000.

Commented [RD134R133]: From Ken: possibly the '70s CUP

Commented [RD135R133]: The 2000 EOL was from the 1977 [WCSI Solid Waste Management Plan \(1977\)](#). I added that information to the table, along with other information from historical land use files.

		47.5 years from Beginning 2002 Based on 425,000 Tons/year and 0.8 Tons/yd ³
2003	Late 2070	2003 Site Development Plan, Page 57, Table 3.1 71.1 Years from Oct 1999 Includes Cells 1-6 and East and West Triangles Based on 400,000 Tons/year and 0.8 Tons/yd ³
2003	2046	2003 Annual Report (Referenced in the chart above)
2010	2053	United States Environmental Protection Agency*
2013	2064	United States Environmental Protection Agency*
2014	2065	United States Environmental Protection Agency*
2015	2061	United States Environmental Protection Agency*
2016	2058	United States Environmental Protection Agency*
2018	2048	United States Environmental Protection Agency*
2019	2044	United States Environmental Protection Agency*
2021	2039	2021 Site Development Plan, Appendix B With detailed breakdown of planned Cell 6 structure and corresponding subcell life expectancy Based on 846,274 Tons/year and 0.8 Tons/yd ³
* EPA Greenhouse Gas (GHG) Emissions Data from Large Facilities , 2010-2021		

Commented [RD136]: The 2003 SDP uses 1999 data, so I think this "late 2070" should be for 1999. The 2003 estimate for EOL is 2046 from that year's annual report.

Commented [RD137R136]: Copied the text and moved to "1999" line. Added strikethrough on this version, for group discussion.

Commented [RD138]: Addition from Ken Eklund

Commented [RD139R138]: These list current EOL projections (starting at 2010), but this chart is for "Historical EOL Projections". This information is already represented in the chart above using more accurate information. I recommend deleting after 2003.

Commented [RD140]: Using EPA information here instead of the standard information from annual reports (which have been referenced throughout the rest of the document) is confusing and less accurate. The EPA does not have a formal role in estimating lifespan, so why would that information be added here instead of the official annual reports?

Commented [RG141R140]: Agreed.

Commented [RD142R140]: From Ginger: [Note: Republic Services agrees with County Staff that EPA data in this chart should be replaced with data Annual Reports filed with Benton County.](#)

C. Coffin Butte Site Life Projection: 2023 to closure

The landfill life projections shown below are provided Republic Services. They are designed to establish a baseline – a simple operational project that more sophisticated scenarios can be built upon.

It presumes:

- d) A steady annual tonnage intake of between 1 million and 1.1 million tons for the duration of the landfill’s projected remaining site life.
- e) Site life is currently projected by Republic Services to be between 14.5 and 16 years, with a closure date between 2037-2039.

Note: This also presumes that the landfill area known as “the quarry” can be fully excavated. A significant portion of permitted airspace at Coffin Butte is currently unusable due to unexcavated rock.

- f) As indicated in the assumptions, this baseline is not a “default future,” in that it does not incorporate outside factors.

|

Scenario 1

Tons per Year	1,000,000 Tons
Projected Remaining Airspace 12/31/22	16,008,557 CY
2022 3-year Density Avg	0.999 Tons/CY
Site Life	15.99 Years

Scenario 2

Tons per Year	1,100,000 Tons
Projected Remaining Airspace 12/31/22	16,008,557 CY
2022 3-year Density Avg	0.999 Tons/CY
Site Life	14.54 Years

Definitions:

Tons per Year: Projected tonnage based off recent history*

Projected Remaining Airspace: Airspace remaining at the end of 2022 based off projected 2022 tons and 2022 3-year density average

2022 3-year Density Avg: Average density measured during 2020, 2021 and 2022 measurements

Site Life: Total site life including the fully excavated quarry area

*Variables can and do impact tonnage and available airspace, and can include changes in disposal and diversion rates, natural disasters and other unforeseen market changes, etc.

The table shown above represents industry-accepted modeling for estimating a Landfill’s remaining life. Modeling is based on three factors: remaining permitted airspace, volume, and density. As noted in the text below the graphic, Republic Services acknowledges that a wide variety of variables, independently or in concert with each other, can impact the baseline(s) enumerated above.

Committee members also want to make clear that the two baseline scenarios shown in the graphic are built on certain assumptions. They are as follows:

- f) **Tons per year** – Projected tonnage based on recent history (2019-2021) and 2020 Franchise Agreement tonnage cap (1.1M tons/year). *Does not reflect variables such as changes in disposal and diversion rates, natural disasters, market, and regulatory changes, etc.*

Commented [RD143]: From Paul: Suggest we just identify this as the formal baseline projection provided by the franchisee and eliminate the redundant versions below (P. 6 & 8).

Commented [RD144R143]: Done

Commented [RG145]: All text here verbatim from Ken’s explanatory text on the revised graphic in the original document. Trying to avoid having the graphic in there twice as it’s currently listed.

- g) **Projected remaining airspace** – Airspace consumed in 2022 based on projected 2022 tonnage and the three-year density average. *“Remaining airspace” includes approximately 2.7M cubic yards of quarry rock; how much of and by when this rock can be converted to airspace is currently unknown.* Quarry extraction in 2022 freed up approximately 140,000 cubic yards.
- h) **2022, three-year-density average** – Derived from 2020-22 measurements. 2022 density based on 2021 measurements.
- i) **Site Life** – Time to fill the projected remaining airspace, including the permitted airspace that is currently unexcavated.
- j) **Landfill Life** is the availability of landfill reserves and landfill alternatives that sustains the landfill’s demand, supply and equilibrium of refuse disposal.

Commented [RG146]: From Chuck - 2/15 email, added here instead of beneath the heading "A" above.

D. Events and Factors that could impact life

As noted, Republic Services and other landfill owners/operators generally estimate a facility’s lifespan by calculating three variables on an annual basis, using data from previous years as a roadmap:

- Amount of space available (airspace)
- Amount of waste accepted (tonnage)
- Density of the waste (tons per cubic yard)

The main discussion in this section is around the various factors that impact the first and second variables: i.e. the amount of space available (airspace) and the amount of waste accepted (tonnage.)

Almost none of the factors relate to density of solid waste, so this discussion excludes that variable. The following graphic summarizes possible impacts of various factors on site life, meaning those that could impact the amount of space available and the amount of waste accepted:

Commented [RG147]: The above paragraphs are verbatim in the existing report.

Commented [RG148R147]: Another note...I need to correct the graphic. It should not have (pandemic) in parenthesis after quarry excavation.

Coffin Butte: Site Life Scenarios

Positive	Neutral	Negative
A recession	Legislation	Remove of tonnage cap
Landfill expansion (CUP)	Legal action	Wildfires/natural disasters
Less waste per capita	Climate change	Impacts/closures of other landfills
Transfer station/disposal alternatives	Activism	Population growth
Global health issues (pandemic)	Quarry excavation (pandemic)	

* Projected remaining site life could increase or decrease depending on a variety of factors. The “positive” category refers to dynamics that could increase site life. The “negative” category refers to those that could reduce or shorten site life. “Neutral” refers to those factors that will not have an impact or where there is not enough information available to predict impact.

The chart above, submitted by Republic Services, lists factors and elements that could impact Coffin Butte’s site life in ways not foreseen in the baseline (Scenario 1 and 2) approach outlined above. The subcommittee believes that it’s likely that one or more of these factors could occur in concert with each other.

Commented [RG149]: Added per Paul’s suggestion.

Commented [RG150]: These paragraphs are from Chuck. I did attempt to pare them down, but if I mischaracterized anything, I am happy to make adjustments. I also believe Chuck wanted to craft a “finding” out of this section and am open to that as well.

For example, an expansion through approval of a CUP is listed as a “positive” factor – meaning one that could increase the Landfill’s site life and longevity. However, it is possible that any positive gain from such a factor would be neutralized or lessened by a “negative” element listed above (such as another wildfire or continued population growth in the region.)

Items listed in the neutral category are defined as such because they serve as “swing” factors – climate change legislation, for example, could yield either a positive or negative impact on site life depending on political influences and authors that shape it.

In addition, the future construction of a transfer station, alternate disposal options and other such factors as contemplated in a wide-ranging Solid Materials Management Plan could likely produce new options for refuse disposal for Benton County and neighboring municipalities and counties.

Therefore, the intent of the above graphic is not to provide an either/or solution, but to convey that an evolving array of factors, including future legislative and economic influences, could produce a matrix of outcomes that not only impact Landfill life but foster new waste management solutions as contemplated by the sustainable management sub-committee.

Assumptions and scenarios

While the subcommittee has generated a list of potential factors that could impact site life, these are by no means exhaustive. Our goal was to begin to describe the “terrain” that the Landfill’s future could traverse.

The subcommittee also agrees that so-called “human factors” play a significant role in any Landfill’s longevity, because they determine not only the flow of material that fills up the Landfill’s permitted volume but what comprises that material.

Unlike the layout of the Landfill or its permitted airspace (factors which are either pre-determined or yield a planned impact) these so-called human variables have the power to shift a Landfill’s operating life unexpectedly and very quickly.

Business decisions and legal obligations, legislation, changing societal attitudes, technological advances global shifts in consumer habits are all key components of a broad system that ultimately determines what is reused as part of a circular economy -- and what is landfilled as waste.

While the A.1 Subcommittee agrees that these factors are real and present, we struggled with how best to present them in terms of predictive scenarios from which the reader could potentially draw conclusions. **we could not reach consensus on the merits of presenting them in terms of predictive scenarios from which the reader could potentially draw conclusions.** The subcommittee members who represent Republic Services and its interests support using the existing modeling data to shape its projections, while acknowledging the “caveats” presented in the graphic above. But they offer no speculative analysis.

Commented [RG151]: Pulled directly from the existing document; the paragraphs that follow are pretty close to existing text. I simplified the “business decisions” sentence.

Commented [RG152]: I believe Ken wanted this to be a finding; I am in agreement that it should be.

The subcommittee members who represent community and neighborhood interests, meanwhile, supported a broader exploration of factors and impacts using predictive processes known as “futurecasting,” and “imagination training.”

Ultimately, we decided as a subcommittee that these human-caused factors and scenarios need further review and detailed analysis, a careful examination that we were neither qualified nor had time to pursue given time constraints and the limited scope of this bridge process.

Therefore, we have posed a multitude of questions that we would like the SMMP subcommittee and its hired experts to delve into, in hopes of providing a more detailed picture of solid waste disposal options and Landfill longevity.

Those questions are enumerated in the table below.

Commented [RG153]: I put these two paragraphs in here in bold because I think it really synthesizes the issue we are having throughout Section 3. Generally speaking, it appears we are in agreement that human and other factors impact site life. We’re diverging in whether to flesh that out into scenarios. Attempted to take the intro from one of Ken’s introductions and frame it into this specific push-pull, without judgement. I think from here we could keep Daniel’s alternate scenario text and Ken’s revised scenario text and put them in an appendix for people to read further.

Coffin Butte: How could site life change from the Baseline Scenario(s)?

Factors that could impact airspace	Background	Questions
<i>Landfill expansion (and Removal of tonnage cap)</i>	<p>a. Republic Services currently operates under a 1.1 million annual tonnage cap. This cap would be eliminated if the Landfill is expanded (under the terms of the 2020 Franchise Agreement.)</p> <p>b. Republic Services is likely to apply to expand the landfill's permitted airspace. Republic Services currently operates under a 1.1 million annual tonnage cap. Under the terms of the 2020 Franchise Agreement, this cap would be eliminated if the Landfill is expanded.</p> <p>MORE: see "4. Landfill expansion and intake limit removal" section below.</p>	<ol style="list-style-type: none"> 1. If the tonnage cap were removed, by how many years could the Landfill's life be shortened, given the existing washed and overall Landfill capacity in the region? 2. Landfill expansion: Will any application to expand the landfill be approved? If so, how many years will be added by the new permitted airspace? Will there be additional applications to expand? 3. Intake cap: If the tonnage cap were removed, by how many years could the Landfill's life be shortened, given the region's capacity for generating landfill material?
<i>Quarry excavation schedule</i>	<p>Our baseline scenario assumes 100 percent of the Landfill's permitted airspace is usable once rock is excavated from the quarry.</p> <p>MORE: see "2. Quarry excavation" section below.</p>	<ol style="list-style-type: none"> 1. What is the likelihood that the quarry is not fully excavated by the time the current cell is filled? Or ever? 2. How would that impact the Landfill's lifespan? 2. What is the likelihood that the quarry is not fully excavated by the time landfilling operations need to begin in that area? Or that it cannot ever be fully excavated? How would that impact the Landfill's lifespan?
<i>Water table concerns</i>	<p>A portion of the Landfill's permitted airspace seems to lie below the groundwater level, and it is unclear whether DEQ regulations allow this airspace to be used, or if it would be cost effective for the Landfill owner to excavate the area.</p>	<ol style="list-style-type: none"> 1. To what extent do DEQ regulation address the water table issue and what steps would the Landfill operator need to take to turn this into "useable airspace?" How could overall site life be reduced by the water table issue? 2. What role if any does Benton County have in protecting its groundwater?

Commented [SM154]: Comment from Ken Eklund: I find the edit implementation in this table to be confusing – it took me a while to parse out generally what has happened, and others may be confused as well. In some cases, if things in cells are outlined (a, b, etc or 1, 2, etc) they represent the old text as a. or 1. and the proposed new text as b. or 2. They're not meant to be read side by side but sequentially, and that should have been explained when the edit was made.

Commented [RD155]: "Landfill expansion (and " added by Ken

Commented [RD157]: Ken's two questions added

Commented [RD156]: Ken's version

Commented [RD158]: Ken's addition

Commented [RD159]: Ken's version of question #1

Commented [RD160]: Ken's addition

Commented [RD161R160]: I believe this is covered in the Legal Issues subcommittee work, and is also not relevant to site life, so probably does not fit in this table.

Disaster concerns (Landfill fire, earthquake)

Landfills can catch fire, either on their surface or as exothermic reactions deep under their surface.
 The ubiquitous presence of methane, a flammable gas, is a risk factor. A landfill fire ignited by an area wildfire is a troubling possibility. Exothermic reactions are deep in the landfill itself and can take years to extinguish. The Landfill is in an earthquake zone and that could also cause crippling damage.

1. What are the risk assessments for fire and earthquake for the Landfill? What options does Benton County have for assessing these risks and being prepared for these contingencies?
2. What is the probability of disasters impacting landfill airspace?

Commented [RD164]: Again, these questions don't seem to relate to the "site life" focus of this table as written. Perhaps rephrase to something like "what is the probability of disasters impacting landfill airspace?"

Commented [RD165R164]: Added below

Commented [RD162]: Addition from Ken

Commented [RD163R162]: This is not a factor impacting airspace as it is described here. Perhaps include how this relates to possible airspace changes, differentiating it from the similar disaster-focused factor in the "annual tonnage" section below.

Commented [RD166]: Daniel's version

Factors related to annual tonnage (demand) Exceedance beyond tonnage cap

Background	Questions
<p>Republic Services could exceed the intake cap, on occasion or on a regular basis. A similar exceedance took place in the years 2017, 2018, 2019, in response to business opportunities.</p> <p>MORE: see "5. Intake Limit Exceeded" section below.</p>	<p>If the tonnage cap were removed, by how many years could the Landfill's life be shortened, given the region's capacity for generating landfill material? What role does Benton County play in incentivizing/disincentivizing any exceedance?</p>
<p><i>Recession</i></p> <p>A slowing or contracting economy, such as the Crash of 2008, generally reduces the volume of waste produced throughout the wasteshed. We saw a decline in tonnage at Coffin Butte Landfill during 2006-2010.</p>	<p>Are current inflationary pressures likely to have any reduction in waste generation at Coffin Butte Landfill? Using history as a guide, how many recessions are we likely to experience between now and Coffin Butte's baseline closure dates? How could recessions/inflation alter the Landfill's projected site life?</p>
<p><i>Economic growth</i></p> <p>If a slowing economy generally reduces waste production, a robust growth economy could increase it. EPA data from 2018 states that 4.9 pounds of municipal solid waste was generated per person per day.</p>	<p>How have waste generation rates changed over time, and specifically during periods of economic growth? Can we project any changes to a Landfill's site life using the data available and forecasting that against the likelihood of economic expansion?</p>

Reductions in waste generation (structural and societal)

<p>a. Increased awareness of the importance of a "circular economy" are prompting societal changes in an effort to divert material from Landfills.</p>	<p>1. What is the likelihood that Benton and surrounding counties will increase their wasteshed recovery rates (listed at 39.3 percent for Benton in 2020, according to Oregon DEQ)? How much tonnage would need to be diverted from the Landfill to have a measurable impact on site life?</p>
<p>b. Oregon environmental policy emphasizes recovery and reuse of solid waste, to insure highest practicable protection of the public health and welfare and air, water and land resources. Desire to decrease the size of wastestreams and increased awareness of the importance of a "circular economy" are prompting structural and societal changes to divert material from landfilling. Example: SB 582, an extended producer responsibility (EPR) law for packaging, became law in 2021, giving producer responsibility organizations (PROs) mandates to improve recycling and other waste diversion plans beginning in 2025.</p>	<p>2. What is the likelihood that counties in the wasteshed will decrease the size of their wastestreams over the next 20 years? What proportion of the tonnage that currently goes into the Landfill is divertable material? What role can Benton County play in reducing waste generation and landfilling in county and in the Landfill wasteshed?</p>

Commented [RD167]: (structural and societal) added by Ken

Commented [RD168]: Ken's version

Commented [RD169]: Ken's version

Commented [RD170]: This question does not focus on site life, so I recommend rephrasing to better fit in this table, or add to an appendix dedicated to questions not covered in the report.

Disposal alternatives

<p>Outside of maximized recovery (recycling and composting), alternatives to Landfilling exist in various forms, primarily in new disposal technology. An incinerator in Marion County burns waste and generates energy for example.</p>	<p>1. What other disposal alternatives exist in the U.S. and elsewhere in the world? Which ones are showing the greatest promise for success and replication (taking in factors like cost, longevity, political will, etc)? How readily could any of these be incorporated into a long-term Solid Materials Management Plan?</p> <p>2. What other disposal alternatives exist in the U.S. and elsewhere in the world? Which ones are showing the greatest promise for success and replication (taking in factors like cost, longevity, political will, etc)? How readily could these be incorporated into the solid waste management plans for cities and counties in the wasteshed? Will Benton County consider these alternatives in its own Sustainable Materials Management Plan?</p>
--	---

Commented [RD171]: Ken's version

<i>Transportation alternatives</i>	Solid waste is currently trucked to Coffin Butte Landfill. Alternative modes of transportation (barge, rail, etc.) are being used to haul trash from intermodal transfer stations to Landfills in more remote, less-densely populated areas.	What are the options for transporting waste using via rail or boat? How could Western Oregon's current network of transfer stations play a role in diverting waste from Coffin Butte? What is the feasibility of using existing railroad networks to haul waste (consider costs, safety, reliability, etc.)?
<i>Global health issues (pandemics)</i>	a. The COVID-19 pandemic had a significant impact on Landfill tonnage, decreasing it dramatically in 2020, but causing a resurgence of waste generation in 2021.	1. Is the COVID-19 pandemic still impacting waste generation? If so, how? What is the likelihood that we will experience another global health crisis in the next decade? How would that potentially extend or reduce the life of Coffin Butte Landfill?
	b. The COVID-19 pandemic had a significant impact on Landfill tonnage, decreasing it dramatically in 2020, but waste generation surged back in 2021.	2. Is the COVID-19 pandemic still impacting waste generation? If so, how? What is the likelihood that we will experience other global health crises in the next two decades? How would that potentially extend or reduce the life of Coffin Butte Landfill?
<i>Climate change legislation</i>	President Joe Biden announced the U.S. Methane Emissions Reduction Action Plan in January 2022 and the Food Donation Improvement Act (designed to reduce food waste and insecurity) was signed into law in January 2023.	Are there plans to expand the requirements of the methane legislation to include Landfills? If so, what is the likelihood of that passing and how could that impact Landfill operations? How much food waste could the new legislation potentially divert from landfills? What other major pieces of legislation are circulating and gaining support? How prohibitive is the "commerce clause" in diverting tonnage away from the Landfill?

Commented [RD172]: Ken's version

Commented [RD173]: Ken's version

<p><i>Climate change and other environmental legislation (A)</i></p>	<p>(A) Concern by the public, science and industry, and financial entities about the climate crisis is manifesting in legislation. President Biden rolled out the U.S. Methane Emissions Reduction Action Plan in November 2021, followed by the Inflation Reduction Act of 2022, which provided for more than \$300 billion in strategic investments to address the climate crisis. This includes incentives to detect, monitor and reduce methane emissions.</p>	<p>Are there plans to expand the requirements of the methane legislation to include landfills? If so, what is the likelihood of that passing and how could that impact Landfill operations? What other major pieces of legislation are circulating and gaining support? Do the climate pollution reduction incentives authorized in the Act present opportunities to fund waste-reduction projects in Benton County and throughout the Landfill watershed? Are there opportunities for Benton County to begin the monitoring of methane emissions at Coffin Butte Landfill?</p>
<p><i>Climate change and other environmental legislation (B)</i></p>	<p>MORE: see Appendix D below.</p> <p>(B) Regarding landfilling, the first effect of the EPA's focus on methane reduction is the Food Donation Improvement Act, signed into law in January 2023. America wastes about 30-40% of its food, and food waste is the most common material found in landfills, estimated at over 20% of material in municipal solid waste by the EPA. When landfilled, food waste converts readily to methane.</p>	<p>How much food waste will the new legislation divert from landfills? How prohibitive is the "commerce clause" in diverting tonnage away from the Landfill? Is environmental legislation creating incentives and opportunities for Benton County and other counties in the watershed to transition to cleaner, less wasteful trash management systems?</p>
<p><i>State and local legislation (commerce, waste generation)</i></p>	<p>Oregon has recently signed into law the Plastic Pollution and Recycling Modernization Act, (SB 582), which mandates changes to recycling programs beginning in July 2025. The law will make expand access to recycling services to disenfranchised populations and upgrade recycling sorting facilities, among other items.</p>	<p>How will this legislation impact recycling and diversion rates? The "commerce clause" prevents Benton County from limiting the source of waste materials into the landfill.</p>

Commented [RD174]: Ken's version of legislation factors (a)

Commented [RD175]: Ken's version of legislation factors (a)

<p><i>This row merged into "Reductions in Waste Generation" State and local legislation (commerce, waste generation)</i></p>	<p>Oregon has recently signed into law the Plastic Pollution and Recycling Modernization Act, (SB 582), which mandates changes to recycling programs beginning in July 2025. The law will make expand access to recycling services to disenfranchised populations and upgrade recycling sorting facilities, among other items.</p>	<p>How will this legislation impact recycling and diversion rates? The "commerce clause" prevents Benton County from limiting the source of waste materials into the landfill.</p>	<p>Commented [RD176]: Deletion of the above row proposed by Ken</p>
<p><i>Activism</i></p>	<p>This ties into climate change legislation, methane reduction and similar topics we are seeing at the state and national level.</p>	<p>What are the new/upcoming areas of focus for climate change activists? Which of these could result in new/tightened legislation impacting Landfill operations? How soon could we see such changes, and would they impact Coffin Butte's site life?</p>	
<p><i>This row moved to become "Climate change and other environmental activism" Environmental activism</i></p>	<p>This ties into climate change legislation, methane reduction and similar topics we are seeing at the state and national level.</p>	<p>What are the new/upcoming areas of focus for climate change activists? Which of these could result in new/tightened legislation impacting Landfill operations? How soon could we see such changes, and would they impact Coffin Butte's site life?</p>	<p>Commented [RD177]: Deletion of the above row proposed by Ken</p>
<p><i>Climate change and other environmental activism</i></p>	<p>People worldwide are increasingly concerned about the threat of uncontrolled releases of greenhouse gases to their quality of life. Methane releases are a focus, because methane is a potent and quick-acting greenhouse gas. Landfills are major sources of greenhouse gas emissions, especially methane, in the United States.</p>	<p>Will activism spark new or accelerate present legislation impacting Landfill operations? How soon could we see such changes? How would they impact Coffin Butte's site life? Will activism create incentives and opportunities for Benton County and other counties in the watershed to transition to cleaner waste management systems?</p>	<p>Commented [RD178]: This question does not clearly relate to site life as written, so I suggest rephrasing or moving to an appendix for other questions not covered in the document. Also "cleaner waste management systems" is not a helpful description for the reader.</p>
<p><i>Wildfires/natural disasters (local and regional)</i></p>	<p>a. Coffin Butte Landfill took in approximately xxxx tons of debris in late 2020-2021 - the result of devastating wildfires in 2020. Disaster debris does not count toward Coffin Butte's 1.1 million annual tonnage cap. b. Fires, floods, spills, and other disasters can suddenly generate large amounts of landfill material. Disaster debris is not limited by the</p>	<p>1. What are options are there for this type of material other than disposal at Coffin Butte Landfill? Does the Landfill's owner/operator have carte blanche to accept this material? Could some of it be diverted to other landfills? Are there other options for mitigating the impacts of such debris on Coffin Butte's site life?</p>	<p>Commented [RD179]: Ken's version</p>

Waste shed changes (closures and creation of other landfills/facilities)

<p>Landfill's 1.1 million annual tonnage cap. Example: devastating wildfires in the mid-Willamette Valley in 2020 generated hundreds of thousands of tons of disaster debris, and Coffin Butte Landfill accepted roughly 300,000 tons of debris for landfilling in late 2020–early 2021.</p>	<p>2. What is the forecast for wildfires and other disasters in the region? What options are there for disaster debris other than disposal at Coffin Butte Landfill? Does the Landfill owner/operator have carte blanche to accept this material? Could some of it be diverted to other landfills? Does Benton County have options for mitigating the impacts of such debris on Coffin Butte's site life?</p>
<p>a. Coffin Butte Landfill takes in about 1/4 of the trash generated and disposed of in Oregon, according to the latest DEQ report. Closure of other regional landfills, such as Riverbend Landfill in Yamhill County resulted in additional tonnage coming into Coffin Butte.</p> <p>b. In recent years Coffin Butte Landfill has taken in 25% to 30% of the total trash generated and disposed of in Oregon, according to DEQ reports. Closure of other regional landfills could create a opportunity for Coffin Butte Landfill to grow its wasteshed. (Additional tonnage would be subject to the intake cap.)</p>	<p>1. What is the current disposal picture for Western Oregon? How many Landfills are operating and how much capacity is remaining in each? Are there any Landfills besides Coffin Butte nearing capacity? How could these dynamics impact tonnage and airspace at Coffin Butte.</p> <p>2. What is the current disposal picture for Western Oregon? How many landfills are operating and how much capacity is remaining in each? Are there landfills nearing capacity? How could these dynamics impact tonnage and airspace at Coffin Butte, or create pressure to do away with or exceed the tonnage cap? Does Benton County have options for influencing or preparing for these outcomes?</p>
<p><i>Industry competition/business choices</i></p> <p>Republic Services competes with other trash haulers and Landfill owners and operators. Industry competition can yield either an increase or decrease in the Coffin Butte waste shed, depending on Republic Services ability to successfully gain or maintain existing contracts.</p>	<p>What market factors could impact Republic Services (and Coffin Butte's) customer base? Who are the other competitors in the market? Which municipalities and counties are nearing the end of their franchise or hauling agreements? Where are the new business opportunities? How could these increase or decrease tonnage coming to the Landfill?</p>

Commented [RD180]: Ken's version

Commented [RD181]: Wasteshed has a specific definition as it relates to materials management in Oregon (each county is typically its own "wasteshed"). This should be rephrased to service area or some other term to not confuse the reader.

Commented [RD182]: "and creation" added by Daniel

Commented [RD183]: Ken's version

Commented [RD184]: Ken's version

Population growth/change

<p>a. Benton County's population is forecasted to grow steadily through 2071, with a population of over 120,000 by 2040.</p>	<p>1. Can we make educated guesses about the waste generation in the County given the influx of new residents and businesses? If Coffin Butte's baseline site life projections don't currently</p>
<p>b. The watershed's population is forecast to grow modestly over the next 20 years, with annual growth rates of less than one percent. Any additional waste tonnage generated would be subject to the Landfill's intake cap.</p>	<p>population growth, how quickly could waste generation consume the projected available airspace? 2. Can Benton County make educated guesses about actual population trends in the Landfill's watershed? Can Benton County make more detailed estimates about future waste generation in the watershed? What options does Benton County have to influence a likely increase in waste generation, both in county and regionally?</p>

Commented [RD185]: Ken's version

Commented [RD186]: Ken's version

E. Coffin Butte Landfill: What factors could make the landfill close earlier than the Baseline Scenario(s)?

The subcommittee paid particular attention to factors that could lead to a landfill closure date earlier than 2037, because such a development could have serious repercussions for Benton County and for everyone else in the landfill’s service area. These factors are discussed in more detail in this section, and graphs with representative assumptions are included to make these prospective outcomes easier to visualize.

1. The **baseline scenario**

Commented [RD187]: All graphs should be updated with "2000 Intake Threshold" instead of the "2000 FA limit" language.

The graph above visualizes Scenario 2 of the formal baseline projection (“baseline”) provided by the franchisee, from Section 3.C Table 1 above. This projection is derived from an upward limit of waste intake of 1.1 million tons a year, which is in turn derived from the limit specified in the 2020 Franchise Agreement, as shown on this graph. We will use this projection in the expanded scenarios that follow.

2. Quarry excavation: “What if the franchisee cannot excavate all of the quarry?”

Roughly 2.7 million cubic yards of the landfill’s permitted airspace is currently unavailable because it is unexcavated rock.⁴ The landfill’s owner holds a surface mining permit for this rock, and franchises it to Knife River as a quarry. For the past few years Knife River has currently quarried the rock at a rate of roughly 150,000 cubic yards a year,⁵ so at a normal pace the airspace will not be fully available until the year 2040.

Commented [PN188]:
 Republic: please confirm or correct this number

This poses a dilemma for the landfill’s owners, because the landfill is on track to fill its current cell in 3 years, when it will look to move operations into the quarry area. The landfill and the quarry cannot safely overlap their operations in the airspace. Ideally, the quarry would pre-excavate all the rock by year-end 2024, and the landfill would then prepare the quarry site for landfilling. Alternatively, the landfill could use a new permitted area (a landfill expansion) as a “bridge” to give the quarry more time to pre-excavate, but it seems unlikely that a landfill expansion could be (a) successful and (b) legally resolved in time to be useful.

⁴ Derived from Knife River testimony before the Benton County Planning Commission, November 2021.

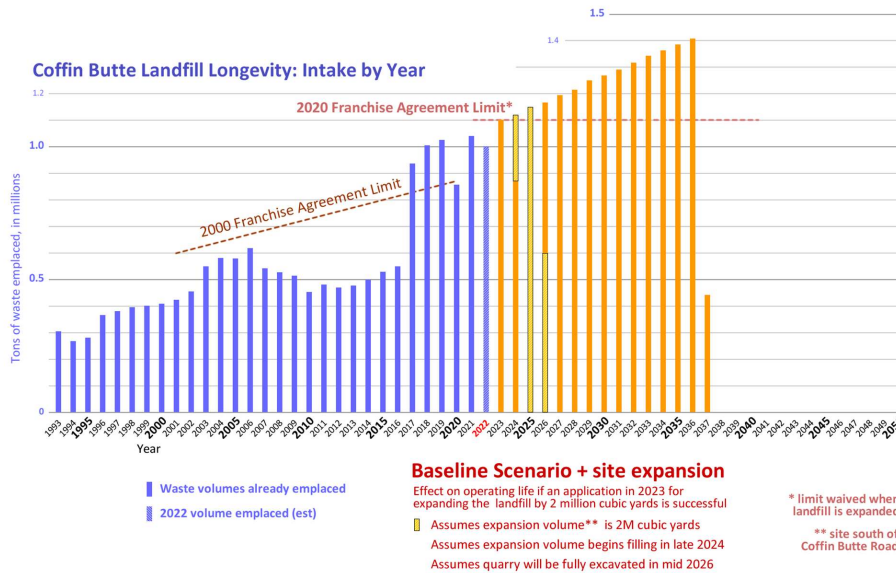

⁵ Derived from Knife River testimony before the Benton County Planning Commission, November 2021.

We do not currently know how much rock can be pre-excavated before landfilling operations move into the quarry airspace. We can display the possibility range graphically, assuming the unexcavated volume is 2.7 million cubic yards.

3. Water table restriction: “What if the franchisee cannot or chooses not to excavate below the water table line?”

A (currently unquantified) portion of the landfill’s permitted airspace seems to lie below the groundwater level, and it is unclear at this time whether or not Oregon DEQ regulations will allow this theoretical airspace to be used. If not permitted, actual permitted airspace would decrease and the lifespan of the landfill would shorten, in proportion to the volume affected.

4. Landfill expansion and intake limit removal: “What if the franchisee obtains a permit to expand the landfill, which will remove the intake cap?”

The baseline scenario may only be fully realized in combination with a landfill expansion – to serve as a bridge landfilling site that allows time for the quarry airspace to be pre-excavated. The landfill owner has indicated that it will apply for such an expansion, likely in the first half of 2023. Almost certainly this expansion site would be the area south of Coffin Butte Road that is already zoned as Landfill Site. The maximal size of this airspace is estimated to be roughly 10M cubic yards (the estimated volume of the withdrawn 2021 expansion application). It’s possible however that the next expansion will follow a different strategy, and be smaller, perhaps even much smaller, than the previous; this would bring about a situation where an increased intake rate could more than offset the volume gain, leading to an overall shorter landfill life.

The graph is a simple projection of this scenario and its effect on baseline longevity, assuming a successful expansion application adding 2M cubic yards.

Note: At the time of this writing, the franchisee represents that they are willing to make the 1.1M intake limit permanent and uphold that limit. If they do so, this scenario assumes current conditions (the limit is waived if the landfill is successfully expanded) no longer applies.

Commented [PN189]:
 Republic: is this accurate? Bill B. seemed to imply that accelerated excavation might solve this.

Commented [PN190]:
 I would note that with the elimination of the 2020 Intake Cap the intake volumes are legally unlimited. A smooth ramp-up as shown could actually be significantly underestimating the intake.

5. Intake Limit Exceeded: “What if the franchisee exceeds the 2020 Franchise Agreement limit?”

The 2020 Franchise Agreement limits the franchisee to a cap of 1.1M tons per year, but does not include any provisions for enforcement of that cap. There is historical precedent; as described earlier in Section 1.C, when the 2000 Franchise Agreement limit was exceeded, Benton County signed a Memorandum of Understanding that allowed the exceedance with no extra fees per ton. There is contemporary precedent also, as the 2020 Franchise Agreement also specifies a fee-per-ton that would apply if the cap were contractually lifted when an expansion was approved. The scenario assumes there are business opportunities that enable the franchisee to grow the yearly intake, because those are what would motivate the exceedance in the first place.

This scenario represents the effect on landfill longevity if the franchisee disregards the intake limit specified in the 2020 Franchise Agreement and the County responds either with no action or with an accommodation agreement such as a per-ton surcharge. It assumes a modest growth rate to intake (less than 2% per year).

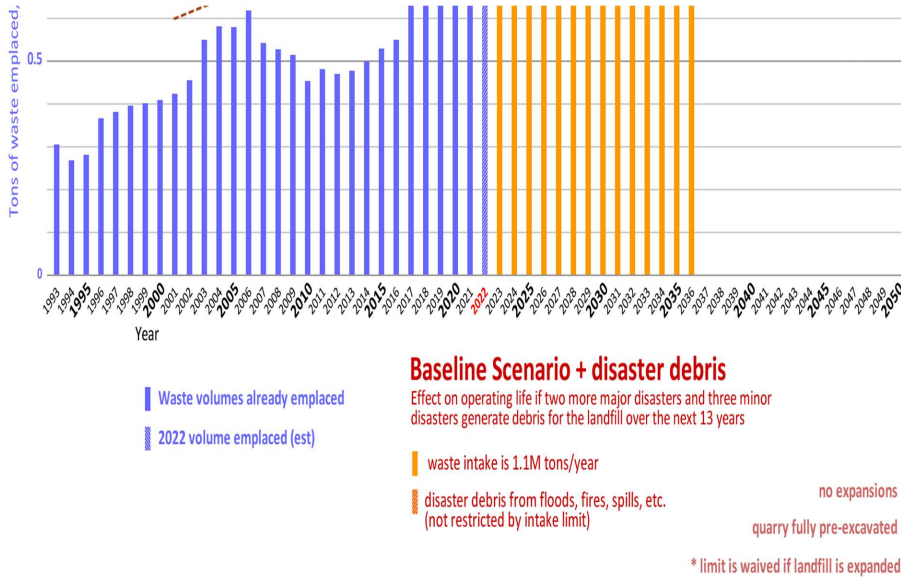

Note: At the time of this writing, the franchisee represents that they are willing to make the 1.1M intake limit permanent and uphold that limit. If they do so, this scenario no longer applies.

6. Disaster debris: “What if there are more disasters like the 2020 Beachy-Creek firewildfires, that generate debris for the landfill?”

Commented [PN191]:
My perception is the fee stated in the MOU was simply the then-current rate. Republic: is this true?

Commented [PN192]:
I would note that with the elimination of the 2020 Intake Cap the intake volumes are legally unlimited. A smooth ramp-up as shown could actually be significantly underestimating the intake.

Commented [KE193]:
Added per Paul’s comment, to make assumptions clear.

Fires, floods, earthquakes, spills, and other major disasters can suddenly generate large amounts of debris to be landfilled. These events also occur more frequently at minor levels. These inflows can reduce the landfill’s life, as disaster debris takes up airspace in the Landfill and is not limited by the Landfill’s 1.1 million annual tonnage cap.

The visualization above assumes that two more major disasters occur in the region before close of Landfill, or roughly once every seven years; plus three minor disasters occur in the same time period, roughly every four years. The two major events each generate about 300,000 tons of debris (roughly the amount of material generated by the area wildfires of 2020) and the three smaller disasters generate 75,000 tons each. These inflows happen in addition to the normal wastestream, which as per the baseline is assumed to be 1.1 million tons per year. here TBA explaining that disasters such as fires, floods and earthquakes have the potential to generate hundreds of thousands of tons of debris to be landfilled, and these inflows are not subject to the landfill intake limit. These inflows can reduce the landfill’s life. Beachy Creek fire generated roughly 350,000 tons?

7. Landfill closure due to external forces.

(Due to landfill fire, earthquake, environmental disaster, environmental litigation/legislation, etc. Short text TBA to come)

Conclusion: A Confluence of Factors – Findings and Recommendations

The subcommittee has generated a Table calling attention to, and posing questions about, potential factors impacting site life; this list is not exhaustive and its characterizations are limited. We hope a more complete list and more detailed characterizations will come as Benton County prepares a Sustainable Materials Management Plan.

These factors are all relevant to understanding the possible longevity of Coffin Butte Landfill. Each factor has its own likelihood of being significant to landfill longevity and its own effect over time, and each joins with other factors to determine the actual longevity. These factors have been included to enable the reader to form a conception of the likely “possibility space” for the landfill’s operation from current day to its End Of Life.

The possibility space shows landfill closure as early as 2034 and as late as 2045.⁶ Within that range, the landfill’s 2021 Site Development Plan estimates the closure year to be 2039 and the EPA shows a closure year of 2044. The franchisee’s baseline projects a closure range of 2037-2039. The franchisee intends to keep intake rates as high as possible, as shown in their baseline projection. Intake-increasing factors such as population growth and debris from disasters may drive up intake rates and thus shorten landfill life within the range; intake reduction factors such as recycling and waste diversion, plus emerging factors such as extended producer responsibility (EPR) incentives and climate crisis legislation, may drive down intake rates and thus lengthen landfill life in the range and beyond.

Commented [RD194]: The group does not have enough supporting evidence to make these specific closure date claims, or any claims comparing the likelihood of scenarios.

⁶ Closure outside of this date range is possible, but seen as less likely

Appendix A: Intake Tonnage and Capacity Data

Coffin Butte annual intake volume, derived from 1993-2021 Coffin Butte Annual Report (CBAR) documents. CY 2000 is highlighted to indicate this value was derived from the 2001 report because the 2000 report document is unavailable. Blue highlights below are assumptions and estimates, not actually recorded data.

Commented [PN195]: I will work with Chuck to consolidate the data from his Appendix B table, and to add backup information for the "2000 FA Limit" item.

Commented [RD196R195]: I've consolidated the table information into the one below.

Commented [RD197]: I recommend using the combined table below, which includes reported airspace.

Commented [RD198R197]: I've consolidated the table information into the one below.

Commented [PN199]: Changed to reflect updated terminology

Commented [PN200]: Added to support Comment 2 following the Intake Tonnage plot

Appendix B: Calculation of 2000 Intake Threshold

From the 2000 Landfill Franchise Agreement Section 8 (b):

“One year after the Effective Date of this Agreement, the tonnage volumes identified in Section 8 (a) above (600,000 tons for one calendar year and 1,200,000 tons for two consecutive calendar years) shall each be increased at an annual rate of the greater of the following two percentages: (i) two percent (2%); or (ii) the increase in total population of Benton, Linn, Polk, Lincoln, Tillamook and Marion Counties as reported by Portland State University, based upon the preceding calendar year.”

Population data from Portland State University for the 2000-2019 period, with calculated Y/Y percentage increase:

From the table above, the population of the specified area did not increase more than 2% Year over Year in any consecutive two-year interval in the CY2000-2019 period.

Therefore the mathematical value of the 2000 Intake Threshold defined in Section 8 of the 2000 Landfill Franchise Agreement is equal to the initial (CY2000) values of 600,000 tons per calendar year or 1,200,000 cumulative tons over any period of two consecutive calendar years, with each figure increased at a rate of 2% per calendar year. The calculated yearly values of the 2000 Intake Threshold are detailed in the table above.

Appendix C: Landfill Properties

Commented [YM201]: This Table really could benefit from a parcel map or maps to orient the reader.

Commented [RD202R201]: Parcel map has been included in the "current footprint" section. This appendix, as I understand it, is intended to be supporting information for both parcel maps in the "current footprint" section.

Coffin Butte Landfill Properties					
	Tax Lot #	Current Zone	Previous Zone (Change Date)	Property Use	Date Acquired and Ownership
1	105130000901	Exclusive Farm Use	Agricultural and Forestry (AF) (1982)	Agriculture	March 2001, Valley Landfills, Inc. Deed 295810-01

Appendix D: Climate change and other environmental activism/legislation Climate Change

Commented [RD209]: From Ken

The potential of environmental activism, litigation, and legislation, especially as related to the climate crisis, is both significant and complex. This Appendix expands on the ideas presented in brief in Table X above.

Commented [RD210]: From Ken

Commented [RD211]: This is another claim of likelihood, which is unsupported. How "significant"? Compared to what?

As cited in Table above. The text below is old, is to be edited

Commented [KE212]:

Background: The Climate Crisis Imperative, and Methane

People all over the world are growing increasingly concerned about the threat the uncontrolled release of greenhouse gases poses to the ecosystems that human societies depend upon. Worldwide, militaries, businesses, governments at all levels, other organizations and the public at large have incorporated or are incorporating responses to this threat into their planning, a response that collectively comprises the "climate crisis." ^{7 8 9 10 11 12 13} 7 8 9 10 11 12 13

Commented [RG213]: Republic Services believes that this entire section and the scenarios that follow should be stricken from the record, as these issues are not within the scope or charge of the site life subcommittee. Further, the scenarios outlined below are based on speculative presumptions that have not yet occurred.

Commented [YM214]: I disagree and oppose the effort to strike this discussion from the record as proposed by Republic Services.

Commented [RD215]: From Ken

²³ Endnotes to come.

²⁴ Endnotes to come...

Landfills are major sources of greenhouse gas emissions methane, according to the EPA.

Landfilling inherently creates methane as a natural byproduct of the decomposition of organic material in landfills. Landfill gas is composed of roughly 50 percent methane (the primary component of natural gas), 50 percent carbon dioxide (CO₂) and a small amount of non-methane organic compounds. Methane and carbon dioxide are odorless; “landfill smell” is from the trace non-methane organic compounds.²⁵

For a more complete context of landfill emissions and their relative greenhouse gas impacts, Oregon's consumption-based greenhouse gas emissions in 2015 show that approximately “one percent of emissions stem from post-consumer disposal of wastes”, leaving about 99% of the consumption-based greenhouse gas emissions resulting from “upstream” consumption of materials in Oregon, including production and supply chain, transportation, wholesale and retail, and use life-cycle phases.²⁶

For a more complete context of Oregon landfill emissions, “Since 1990, [sector-based] statewide emissions from waste have increased from 1.7 million MTCO₂e to 2.3 million MTCO₂e. Additionally, while statewide emissions decreased from 2005 through 2011, emissions from waste increased during the same time period. The majority of emissions from waste are fugitive methane emissions from municipal solid waste landfills in Oregon.” Oregon's consumption based greenhouse gas emissions for waste (post-consumer disposal) in 2015 are estimated at 500,000 MTCO₂e. Sector-based emissions are those produced in Oregon; consumption-based emissions are those produced around the world due to Oregon's consumption of energy, goods and services.²⁷24

Commented [RD216]: “Major” compared to what? Do you mean “major” in terms of point source facilities? As shown in my proposed edits, waste disposal (including landfills) actually contributes a very small portion GHG impacts associated with materials. In short, the original description lacks important context, and includes no supporting data/evidence.

The reader will likely be interested in knowing how landfills emissions compare to emissions associated with the lifecycle of materials, because you put landfills in the context of all climate impacts. I added that contextual information in red. In general, upstream lifecycle stages and materials management is much more impactful in terms of GHG emissions.

This information is important to include because in this section you are making a claim about landfill's relative impacts on climate change (relative, because you use the word “major”). So it is important to provide the reader with the opportunity to see the bigger picture.

Commented [RD217]: Ken's version proposed to replace Daniel's addition in the paragraph above.

Commented [RD218R217]: This does not address the relative greenhouse gas impacts in any way, and still does not provide “a more complete context”. 2.3 million for sector based waste emissions and at 500,000 MTCO₂ for consumption based waste emissions aren't helpful numbers without the context of total emissions in each of those emissions calculations. 89 million MTCO₂e total emissions for sector-based, means waste is about 2.6% of total. And again, post consumer disposal of waste represents about 1% of consumption-based emissions.

²⁵ Environmental Protection Agency, “Basic Information about Landfill Gas.” link

²⁶ Oregon's consumption-based greenhouse gas emissions in 2015. Post-consumer disposal = 0.5 million MTCO₂e. Total Oregon consumption-based GHG emissions = 88.7 million MTCO₂e.

²⁷ “Oregon's Greenhouse Gas Emissions through 2015: An assessment of Oregon's sector-based and consumption-based greenhouse gas emissions,” May 2018. link

Figure 13

2005-2015 Oregon consumption-based greenhouse gas emissions, by life-cycle stage

Commented [RD219]: I added this figure as support/documentation for the information provided above.

It's known that Coffin Butte Landfill has greenhouse gas emissions, but to date they have not been well-characterized by Republic Services or by Benton County. The US Environmental Protection Agency estimates that Coffin Butte Landfill's methane collection system converts 57% of its methane to CO2, which is relatively inefficient as compared to other Oregon landfills such as Columbia Ridge (85%) and Dry Creek (80%).²⁸²⁵

Changes to the Landfill's emissions status in the near future

In the past methane pollution has been difficult to quantify. For landfills, historically the EPA has relied on theoretical calculations to estimate pollution, but these mathematical models by definition produce estimates, not exact data – useful at a national level but less so at a perlandfill level. In response, other organizations have engineered their own models that are more useful for assessing emissions at a particular landfill. In recent years, focus has shifted to bePer direct measurement technologies for more accurate and transparent emissions reporting.²⁹²⁶

Using area measurement tools deployed on satellites, aircraft, and towers, the Environmental Defense Fund has shown that landfill outputs are generally higher than EPA calculations indicate. Carbon-Mapper, a joint public-private enterprise, focuses on identifying superemi Pers, because a previous flyover project across California discovered that only 1% of sites

²⁸ "Emission Data for the Designated Pollutants," Oregon Amended State Plan to Implement Emissions Guidelines for Municipal Solid Waste Landfills, Oregon Department of Environmental Quality, August 1, 2019.

²⁹ "Methane menace: Aerial survey spots 'super-emiPer' landfills," Reuters, June 2021 link

produced 50% of methane emissions, and the largest emissions were from landfills.³⁰27 Carbon- Mapper plans to launch two satellites in 2023, building to a suite of 20 satellites eventually; these will join other systems such as Kayrros, a French company, GHGSat, a Canadian company, and MethaneSAT, a subsidiary of the EDF.³¹28

These developments all signal a changed operating environment for Coffin Butte Landfill, one in which its greenhouse gas emissions move from being unknown and unexamined to being an open number impacting business competitiveness, waste flows, operating costs, regulatory fines, corporate investment levels, public action, and more.³²29 Coffin Butte Landfill may be a particular target particular target for negative effects, because its wet environment converts waste to methane quickly.

It's important to note that landfill methane poses a lesser-of-evils situation. The best-case environmental outcome for methane, once it is generated from municipal solid waste, is for it to oxidize into carbon dioxide, i.e., for it to transition from a quick-acting high-impact greenhouse gas into a slower-acting, durable greenhouse gas. Methane is not “destroyed” nor does it become carbon neutral. Therefore, the best way to mitigate landfill methane is never to create it in the first place, i.e., to divert waste, especially organic waste, from ever entering a landfill. This is a fundamental logic at work with landfill methane now and into the future.³³30

In the past methane pollution has been difficult to quantify. For landfills, historically the EPA has relied on theoretical calculations to estimate pollution, but these mathematical models by definition produce estimates, not exact data — useful at a national level but less so at a per-landfill level. In response, other organizations have engineered their own models that are more useful for assessing emissions at a particular landfill. In recent years, focus has shifted to better direct measurement technologies for more accurate and transparent emissions reporting.

³³ “The first priority for landfills continues to be avoiding landfilling materials altogether,” the CARB spokesperson said, “which provides the most direct path for reducing landfill methane emissions.” “With landfill methane in the climate spotlight, satellite and flyover measurements aPract a following.” Waste Dive, November 2021. link

Mapper plans to launch two satellites in 2023, building to a suite of 20 satellites eventually; these will join other systems such as Kayrros, a French company, and MethaneSAT, a subsidiary of the EDF.

These developments all signal a changed operating environment for Coffin Butte Landfill, one in which its greenhouse gas emissions move from being unknown and unexamined to being an open number impacting waste flows, operating costs, regulatory fines, corporate investment levels, public action, and more. Coffin Butte Landfill may be a particular target for negative effects, because its wet environment converts waste to methane quickly. This section details several Scenarios which explore these impacts upon the landfill's anticipated operating life.

It's important to note here that landfill methane poses a lesser-of-evils situation. The best-case environmental outcome for methane, once it is generated from municipal solid waste, is for it to oxidize into carbon dioxide, i.e., for it to transition from a quick-acting high-impact greenhouse gas into a slower-acting, durable greenhouse gas. Methane is not "destroyed" nor does it become carbon neutral. Therefore, the best way to mitigate landfill methane is never to create it in the first place, i.e., to divert waste, especially organic waste, from ever entering a landfill. This is a fundamental logic at work with landfill methane now and into the future.

Commented [RD220]: What do you mean by "target for negative effects". That wording does not seem to flow very well.

Scenarios

A. Climate Crisis Legislation

The US focus on methane reduction for landfilling began manifesting in January 2023, with the signing of the Food Donation Improvement Act. America wastes about 30-40% of its food, and food waste is the most common material found in landfills, estimated at roughly a quarter of material. When landfilled, food waste converts readily to methane. The bipartisan Act offers benefits beyond methane reduction, which is typical when initiatives target waste.^{34 35}[31 32](#)

The Inflation Reduction Act of 2023 imposed methane-corrective measures on the oil/gas industry. These measures are focusing on incentives to prevent methane from being emitted but include penalties for methane pollution. These penalties are being eased in over a four-year period, and establish a rate for methane pollution: \$1550 per metric ton in 2022 dollars.³⁶[33](#)

³⁴ "Here's Why Congress Should Pass The Food Donation Improvement Act," Forbes, March 2022, [link](#)

³⁵ "Reducing food waste seems to be one of those areas that is a win-win situation. No one is benefiting when we throw food away. The production of food itself causes emissions, and when the food goes to the landfill, it's a huge emitter of methane. So that's not good on either end of it." The Harvard Gazette, "How food donations can help fight hunger and climate change," August 2021, [link](#)

³⁶ "Inflation Reduction Act Adds First-time Charge for Methane Emissions for the Oil and Gas Sector," O' Melveny, August 2022, [link](#)

It's possible that similar methane-corrective measures will be imposed upon the landfill industry, as a next development in the US 2021 Methane Emissions Reduction Plan. Such a development would be in accord with the stated goals of the US government, its commitments to climate action to the world, and goals and provisions already in place with the US 2021 Methane Emissions Reduction Plan.

In general, the effect of this carrot + stick scenario on Coffin Butte Landfill's operating life may be to lengthen it. The incentives may attract recyclers and other entities to target the high organic sector of the landfill's intake (about a quarter of total intake mass) for diversion away from the landfill, and the penalties may bring the landfill operator into alignment with this diversion (despite the concurrent reduction of profit). This change in wasteflow may create knock-on opportunities to create circular economies for other types of waste, motivated by environmental concerns, economic efficiencies, and other reasons. The likelihood of these eventualities depend upon the actual methane output of the landfill, which is currently undocumented.

~~Scenario: the methane-corrective measures imposed on the oil/gas industry are extended into the landfill industry, focusing on incentives to prevent methane from being emitted but including penalties for methane pollution. This extension happens in the year 2024.~~

~~In this scenario, as they are doing in the oil/gas industry, federal and state environmental agencies offer billions of dollars in incentives tailored to catalyze efforts that can curtail landfill methane.~~

~~In this scenario, federal and state environmental agencies announce and implement financial penalties (fines) for methane release to the atmosphere. As is currently happening in the oil/gas industry, these penalties are eased in over a four-year period, and cap at a rate around \$1550 per metric ton in 2022 dollars.~~

~~In general, the effect of this carrot + stick scenario on Coffin Butte Landfill's operating life would be to lengthen it. The incentives would attract recyclers and other entities to target the high-organic sector of the landfill's intake (about a quarter of total intake mass) for diversion away from the landfill, and the penalties would bring the landfill operator into alignment with this diversion (and reduction of profit). This would be a sea change in the wasteflow, creating knock-on opportunities to create circular economies for other types of waste, motivated by environmental concerns, economic efficiencies, and other reasons.~~

~~It's also possible that this scenario would shorten the operating life of Coffin Butte Landfill, even precipitously, if the prospective penalties for incoming waste (plus the penalties for methane emissions from waste already emplaced) cut unacceptably into the profit schema of the landfill owner. The likelihood of this eventuality depends upon the actual methane output of the landfill, which is currently undocumented.~~

Commented [RD221]: This applies to the scenario above as well. If the amount GHG produced by the landfill's baseline is less than the threshold for penalties, there is no incentive for change. I copied and pasted this sentence above for consideration.

The signal for this scenario is strong, because it is based upon the stated goals of the US government, its commitments to climate action to the world, and goals and provisions already in place with the US 2021 Methane Emissions Reduction Plan.

Another legislative scenario to mention briefly, related to the climate crisis: efforts to limit atmospheric carbon widen to non-methane sources in the US, in the form of a carbon tax and/or subsidies for rail electrification. This scenario would disrupt the current operations in the Coffin Butte watershed, by establishing new incentives to transport waste by rail rather than truck. This scenario is likely to extend the operating life of Coffin Butte Landfill, which has no rail connection and depends on trucking for its inflow. If entities can transport waste more economically by rail to cleaner landfills or to regional waste reclamation centers, that would cut inflow to Coffin Butte Landfill.

Commented [RD222]: "Strong" compared to what? Again, language used here comes without supporting data (comparing "signals" for various scenarios). From our group discussion, it sounds like the US 2021 Methane Emissions Reduction Plan does not currently include landfills. And, as mentioned above, landfills are very low GHG emission sources compared to other lifecycle stages of materials, which may reflect legislative priorities.

Commented [RD223]: What do you mean by "cleaner landfills". The idea of comparing landfills' cleanliness (or GHG emissions?) has not come up yet in this document or group discussion, so it should be clarified or removed.

B. Climate Crisis Legal and Shareholder Action

As part of the climate crisis, environmentally engaged citizens and environmental organizations are suing governmental agencies (and investors are suing corporations) for failing to act on the climate crisis³⁷. As with climate crisis legislation, these lawsuits may compel action to reduce emissions of greenhouse gases, which in turn may boost efforts to divert material, especially food and other high organic waste, from being landfilled at Coffin Butte Landfill. These lawsuits have the potential to occur across the landfill's service area. As with climate crisis legislation, the effect would be to reduce waste inflow into the landfill and thus lengthen its operating life.

Scenario: Environmentally engaged citizens sue governmental agencies (and investors sue corporations) for failing to act on the climate crisis. These lawsuits compel action to reduce emissions of greenhouse gases, which in turn boost efforts to divert material, especially food and other high organic waste, from being landfilled at Coffin Butte Landfill. In this scenario, these lawsuits have the potential to occur across the watershed.

Signals for this scenario set exist in plenty. Groups of environmentally engaged citizens are already pursuing lawsuits against states and nations; such cases appear regularly in the news as current ones wind their way through the courts and new ones are filed. Climate activism is already widespread in Oregon and the landfill's watershed includes areas disposed politically toward this kind of legal action. Benton County is more likely than most to be targeted for this kind of lawsuit, as its population generally prioritizes environmental concerns and the County

Commented [RD224]: "More likely" in what way, and compared to where? This claim is unsupported by any evidence in the document

³⁷ "Growing numbers of customers and investors are insisting that all industries – waste included – record greenhouse gas emissions and shrink their carbon footprints. In a relatively short period, considering how a company may be exacerbating the effects of climate change morphed from a peripheral concern for investors to a mainstream inquiry." "Renewed focus on landfill calculations as waste industry faces pressure to reduce emissions," Waste Dive, March 2021. [link](#)

has not shown concern over greenhouse gas emissions in its administration of Coffin Butte Landfill.

"I started looking at the world through a new lens recently — when my older daughter gave me the incredible news that I'll become a grandfather next year... I can sum up the solution to climate change: We need to eliminate global emissions of greenhouse gases by 2050... We need to revolutionize the entire physical economy... If we don't get to net-zero emissions, our grandchildren will grow up in a world that is dramatically worse off." The grandfather to be is Bill Gates, a major shareholder in Republic Services' stock.

This scenario would further extend the operating life of the landfill if methane studies show that Coffin Butte Landfill is a worse polluter than alternative landfills in drier climates (if Coffin Butte Landfill converts waste to methane more quickly, for example). The legal action would then not only divert high-organic material out of the wastestream, but divert unsorted waste away from Coffin Butte Landfill to less-polluting alternatives.

~~D.C.~~ **C.** — Climate Crisis Environmental Activism

As part of the climate crisis, environmental activists accelerate their efforts, and act as an across-the-board accelerant and forcer for all the environmentally motivated changes being discussed in this Appendix.

The effects of environmental activism on the operating life of Coffin Butte Landfill have been mixed. Environmental activism has already caused the single most impactful event on the operating life of Coffin Butte Landfill in its recent history: as described elsewhere in this report, activists were instrumental in stopping the expansion of the Riverbend Landfill in Yamhill County, which enabled Republic Services to increase trash intake at Coffin Butte Landfill by over 50% beginning in 2017. Other activism focused on pollution other than that at Coffin Butte Landfill may have similar effects that shorten the landfill's operating life. Activism focused on trash reduction or on the landfill itself may extend the landfill's life, if they act to reduce waste flows into the landfill.

Scenario: Environmental activists accelerate their efforts to increase accountability for, and limit waste intake at, Coffin Butte Landfill. These efforts consist mostly of expansion to the current level of civic engagement but also branch out as protests and other direct action when civic engagement cannot produce the depth and velocity of change required for environmental protection.

This scenario is similar to, and operates in tandem with, the "legal action" scenario, and has a similar effect of reducing intake at the landfill. Activism happens more quickly however, so the primary impact of this scenario is as an across-the-board accelerant and forcer for all the environmentally motivated changes being discussed in this section.

Commented [RD225]: This is not accurate, and is not supported by any information/data/evidence in the document.

Commented [RD226]: Benton County does not administer the landfill. This is not accurate.

Signals for environmental activism's impact on the operating life of Coffin Butte Landfill are very strong. Environmental activism has already caused the single most impactful event on the operating life of Coffin Butte Landfill in its history: activists stopped the expansion of the Riverbend Landfill in Yamhill County, which effectively doubled trash intake at Coffin Butte Landfill to its current high level. Local activism is why the County has assembled its Workgroup studying the future of solid waste management in Benton County, and local activists feature prominently in the work done by the Workgroup so far.

Commented [RD227]: "Strong" compared to what? Again, language used here comes without supporting data (comparing "signals" for various scenarios).

Commented [RD228]: Is this accurate? There is no supporting information for this claim. Is it more accurate to say that community opposition to the expansion played a role, along with other factors in the complex dynamics?

Commented [RD229]: I do not think this is an accurate representation of why BCTT started. I recommend getting guidance from Sam and the County to confirm.

Commented [RD230]: There are "lines of reasoning" which do not match the "lines of reasoning" proposed by Ken, as noted in the comments. This applies to the first sentence. The second sentence seems to match what the subcommittee has discussed, but is also unnecessary since the document already mentions that each of these elements have potential to impact the landfill EOL.

No Counterreasoning or Counterevidence Presented

No lines of reasoning or evidence were presented in subcommittee in answer to the lines of reasoning and evidence outlined in this Appendix. No arguments or evidence were brought forward to establish that Coffin Butte Landfill would not be subject to climate crisis-related advances in measuring technology, waste diversion technologies and policies, and legislation, legal and shareholder action, and activism, and that these developments would not have effects on the operating life of the Landfill.

D. Climate Crisis Effects Upon Landfill Operating Life

Scenarios: effects of the climate crisis itself circle back to affect the operating life of Coffin Butte Landfill, by increasing the incidence of wildfires, floods, droughts, and other disruptions to the landfill's extensive infrastructure; by causing rapid and novel shifts in population migrations and attitudes; by posing threats to the landfill's operational status itself.

Signals for this set of scenarios are strong. Worldwide, the number and severity of climate events and disasters is growing, made more extreme by climate crisis effects. Locally, in 2020 the Beachie Creek-Lionshead wildfire generated about a third of a million tons of debris for Coffin Butte Landfill. The region continues to slide into multi-year drought, which extends the fire season in an area already at risk with high forest fuel loads. The Willamette Valley now has a regular "smoke season." Rain events are growing in severity, increasing chances for flood events in the landfill's watershed and on the landfill itself. As a creator of flammable methane, the landfill has clear potential for a major fire event; it has caught fire in the past, which on one occasion called for a large fire response and took over 24 hours to bring under control.

Despite these trends, the Pacific Northwest is seen as a haven for those elsewhere who have been even more severely impacted by heat, fire, flood and other disasters.

In the main, climate crisis events are likely to shorten the landfill's operating life. Fires and flooding have the potential to generate debris flows that will consume capacity, as would a population boost from climate refugees relocating into the watershed.

The most extreme scenarios shorten the landfill's operating life precipitously. The landfill itself could have a flooding event, where leachate cannot be pumped out fast enough or overflows its collection ponds for example, with effects unknown upon the landfill's

Commented [YM231]: None of these waste streams are counted in the "tonnage cap" included in the 2020 franchise agreement

Commented [KE232]: The debris isn't affected by the cap, but it still shortens landfill life by occupying volume in the landfill

Commented [RD233]: "Likely" compared to what? Where is the data or information to support the likelihood claim you are making? This subcommittee has not done the research needed to conclude the likelihood of any scenarios we've discussed, so this claim is not necessarily accurate.

ability to continue operations. Wildfire is a clear existential threat, as landfills are full of both incendiary methane and flammable material; landfill fires can burn deep, are difficult to fight and have been known to burn for years and take over a hundred million dollars to extinguish.

These events concatenate: a storm event, for example, might knock out power to the landfill for an extended period, which then leads to a flood event as pumps cannot operate. An earthquake could cause both a power outage, which collapses the landfill's ability to operate its methane extraction system, and multiple wildfires, which threaten to ignite the uncontrolled methane. In such scenarios, the landfill is not a direct threat to human life and thus not a priority for firefighters or other emergency action, so any incident can snowball.

Conclusion

In recent years society and its structures have begun to take action on the climate crisis, due to the threat that greenhouse gases pose to natural and social systems. Responses to the climate crisis focus mainly on curtailing the release of greenhouse gases, but also include mitigating or adapting to the emerging effects of climate change. Efforts to curtail the release of greenhouse gases pay special attention to methane, because this pollutant has fast-acting effects. Landfills such as Coffin Butte are known to be major emitters of methane, and some recent studies indicate that US landfills release significantly more methane than had been previously characterized by EPA estimates. The methane emission level of Coffin Butte Landfill has not been well-characterized. DEQ estimates emissions from disposal of waste to be <1%-2.6% of total emissions.

New technologies that measure methane emissions directly (rather than estimate them using mathematical modeling) have been developed and are being deployed worldwide, on satellites, aircraft, and overlook towers. The operating environment of Coffin Butte Landfill is likely to change as its greenhouse gas emissions become well-characterized, subjecting the landfill to competitive pressure, regulatory fines, shifts in corporate strategy, public action, and other effects. Coffin Butte Landfill's wet environment is known to convert waste to methane quickly, so these changes may decrease waste inflows and thus lengthen the operating life of the landfill.

The most effective way to curtail a landfill's greenhouse gas emissions is to divert organic material from being landfilled. Landfill gas collection systems lessen the greenhouse gas impact but do not remediate it, because they do not collect all of the methane generated by a landfill; they do not completely combust the methane that is collected; they generate carbon dioxide, a greenhouse gas, when they combust methane; and half of landfill gas is carbon dioxide, which gas collection systems release into the atmosphere. In 2019 the EPA estimated that Coffin Butte Landfill's gas collection system operates at 57% efficiency.

The impetus to curtail methane emissions is focusing attention on ways to divert organic waste from landfill wastestreams. In the US, the Food Donation Improvement Act enables existing

Commented [RD234]: Many of these examples you list have the potential to temporarily reduce intake tonnage, thus extending landfill life.

Commented [RD235]: Addition from Daniel, to add a conclusion on the contextual discussion above.

Commented [RD236]: How likely, and where is the data to support this claim? This claim of likelihood is not something that our subcommittee can make with the information we have.

Commented [RD237]: How quickly, and compared to what? I recommend using more objective language.

food donation organizations to expand operations dramatically, and incentivizes the creation of new methods and innovations in preventing food waste. The 2021 Methane Emissions Reduction Plan catalyzes and incentivizes ways to identify and cost-effectively reduce methane emissions from all major sources. The 2023 Inflation Reduction Act of 2023 focuses on incentives to prevent methane from being emitted, but included the rollout of penalties for methane pollution in the oil/gas industry, which could extend in time to the waste industry in some form. These emerging legislative drivers go hand in hand with emerging litigation, shareholder action, and activism over environmental protection, all of which have the potential to affect significantly how landfilling will be done in the future.

Commented [RD238]: Recommend removing this word, making the sentence more objective

The baseline scenarios laid out elsewhere in this report assume that landfilling will continue as normal for the next 16 years. That expectation should be tempered by the signals that environmental considerations, especially those related to the climate crisis, are emerging as a major factor that will reshape the social and legal landscape that Coffin Butte Landfill is in. This reshaping is something that Benton County can participate in, on behalf of its citizens. This is something the County should be aware of and prepare for, in current actions and in concert with its Sustainable Materials Management Plan, as the reshaping includes significant opportunities for the County and affiliated organizations to bring their waste management more in line with the County's stated goals and values.
